Introduction xxvii

PART I: Miscellaneous Information

SECTION 1: General Information 1-1

| Numeric Conve | rsions |
|----------------|--|
| Hexadecima | 1 |
| 1.01 | Hexadecimal to Decimal Number Conversion 1-2 |
| 1.02 | Hexadecimal to Binary Number Conversion 1-3 |
| 1.03 | Hexadecimal to Octal Number Conversion 1-3 |
| 1.04 | Hexadecimal Addition Tables 1-4 |
| 1.05 | Hexadecimal Multiplication Tables 1-6 |
| Binary | |
| 1.06 | Binary Number Conversions 1-7 |
| 1.07 | Binary to Signed Decimal Number Conversion 1-8 |
| Octal | |
| 1.08 | Octal to Decimal Number Conversion 1-9 |
| 1.09 | Octal to Hexadecimal Number Conversion 1-9 |
| 1.10 | Octal to Binary Number Conversion 1-10 |
| Decimal | |
| 1.11 | Decimal to Binary Number Conversion 1-11 |
| 1.12 | Decimal to Hexadecimal Number Conversion 1-12 |
| 1.13 | Decimal to Octal Number Conversion 1-12 |
| Common Data F | Formats |
| 1.14 | Two's Complements 1-13 |
| 1.15 | Common 8086 Family Data Formats 1-14 |
| 1.16 | Common Numeric Data Formats 1-14 |
| 1.17 | Common String Formats 1-16 |
| 1.18 | Common Memory Area Terminology 1-16 |
| 1.19 | Binary Coded Decimal Number Format 1-17 |
| ASCII | , |
| 1.20 | ASCII Control Codes 1-18 |
| 1.21 | ASCII Character Set 1-19 |
| 1.22 | IBM ASCII Character Set 1-20 |
| 1.23 | IBM Keyboard Extended Function Codes 1-22 |
| 1.24 | Line Drawing Character Set 1-24 |
| EBCDIC | c . |
| 1.25 | EBCDIC Character Set 1-25 |
| Other Elements | |
| 1.26 | Digit Positions in Common Bases 1-27 |
| 1.26 | Powers of Two 1-27 |
| 1.27 | ASCII and International Sort Ordering 1-28 |
| 1.28 | Truth Tables for Logical Operations 1-29 |
| 1.29 | Trum Tables for Logical Operations 1-29 |

PART II: Software

SECTION 2: DOS Commands, Utilities, and Summaries 2-1

| DOS Comman | ds |
|---------------|--|
| 2.01 | DOS Command Summary 2-3 |
| 2.02 | Exit Codes Returned by DOS Commands 2-9 |
| 2.03 | DOS Extended Error Messages 2-10 |
| 2.04 | DOS Parse Error Messages 2-11 |
| DOS Comman | d Utilities |
| 2.05 | Editing DOS Command Lines 2-11 |
| 2.06 | Batch File Commands 2-12 |
| 2.07 | CONFIG.SYS Commands and Default Settings 2-13 |
| 2.08 | PROMPT Special Characters 2-14 |
| 2.09 | PROMPT ANSI Control Strings 2-15 |
| 2.10 | PROMPT ANSI Display Attribute Strings 2-16 |
| 2.11 | Device Driver Parameters 2-17 |
| DOS Utilities | |
| 2.12 | DEBUG Command Summary 2-18 |
| 2.12 | EDLIN Command Summary 2-20 |
| 2.13 | LIB Operators Summary 2-21 |
| 2.15 | LINK Parameters Summary 2-21 |
| 2.16 | DOSSHELL Program Startup Options 2-22 |
| 2.17 | DOSSHELL Program Special Key Assignments 2-23 |
| 2.17 | DOSSILLE Program opecial resy resignment |
| DOS Disk Lay | |
| 2.18 | Directory Entries 2-24 |
| 2.19 | File Attribute Byte 2-24 |
| 2.20 | Date/Time Formats 2-25 |
| 2.21 | FAT Layouts 2-26 |
| 2.22 | Disk ID Bytes 2-26 |
| 2.23 | Disk Boot Record Layout 2-27 |
| 2.24 | Disk Partition Table Layout 2-27 |
| 2.25 | Floppy Disk Format Summary 2-29 |
| 2.26 | IBM Hard Disk Format Summary 2-29 |
| DOS File Lay | outs |
| 2.27 | EXE File Header 2-30 |
| 2.28 | COM Program Layout 2-30 |
| 2.29 | COM versus EXE File Differences 2-31 |
| 2.30 | Font File (Code Page) Layout 2-31 |
| 2.31 | Operating System Files Summary 2-32 |
| 2.32 | Included Command Files Summary 2-32 |
| 2.33 | Common File Types (Extensions) 2-34 |
| | |
| Other | Typical DOS Memory Usage 2-37 |
| 2.34 | Typical DOS Memory Usage 2-37 Allowable Characters in Filenames 2-38 |
| 2.35 | |
| 2.36 | Filename Separator Characters 2-38 |

SECTION 3: DOS Function Calls and Support Tables 3-1

```
INT 21H Function Summaries
       3 001
              INT 21H Functions by DOS Version Summary 3-6
              INT 21H Keyboard Functions Summary 3-8
       3.002
              INT 21H FCB-Oriented Functions Summary 3-9
       3.003
              INT 21H Handle-Oriented Functions Summary 3-10
       3.004
       3.005
              INT 21H IOCTL Device-Oriented Functions Summary 3-11
       3.006
              INT 21H Directory Management Functions Summary 3-12
       3.007
              INT 21H Drive Management Functions Summary 3-12
              INT 21H File-Sharing Functions Summary 3-12
       3.008
              INT 21H Character I/O Functions Summary 3-13
       3.009
       3.010
              INT 21H Memory Management Functions Summary 3-13
       3.011
              INT 21H Program Management Functions Summary 3-14
       3.012
              INT 21H National-Language Support Functions Summary 3-14
              INT 21H System Management Functions Summary 3-15
       3.013
              INT 21H Network Functions Summary 3-15
       3.014
INT 21H Functions
              Typical DOS Register Use 3-16
       3.015
              INT 21H, AH=00H - Terminate Program 3-16
       3.016
       3 017
              INT 21H, AH=01H - Read Keyboard with Echo 3-17
              INT 21H, AH=02H - Display Character 3-18
       3.018
              INT 21H, AH=03H - Auxiliary Input 3-19
       3.019
       3.020
              INT 21H. AH=04H - Auxiliary Output 3-19
       3.021
              INT 21H. AH=05H - Print Character 3-20
              INT 21H, AH=06H — Direct Console I/O 3-20
       3.022
       3.023
              INT 21H, AH=07H - Direct Console Input 3-21
       3.024
              INT 21H, AH=08H - Read Keyboard without Echo 3-22
       3.025
              INT 21H. AH=09H - Display String 3-22
       3.026
              INT 21H, AH=0AH — Buffered Keyboard Input 3-23
       3.027
              INT 21H, AH=0BH — Check Keyboard Status 3-23
              INT 21H, AH=0CH - Flush Buffer, Read Keyboard 3-24
       3.028
              INT 21H, AH=0DH - Reset Drive 3-24
       3.029
              INT 21H, AH=0EH - Set Default Drive 3-25
       3.030
              INT 21H, AH=0FH - Open File with FCB 3-25
       3.031
              INT 21H, AH=10H - Close File with FCB 3-26
       3.032
              INT 21H, AH=11H - Find First File with FCB 3-26
       3.033
       3.034
              INT 21H. AH=12H — Find Next File with FCB 3-27
              INT 21H, AH=13H - Delete File with FCB 3-28
       3.035
       3.036
              INT 21H, AH=14H - Sequential Read 3-28
              INT 21H, AH=15H - Sequential Write 3-29
       3.037
              INT 21H, AH=16H - Create File with FCB 3-30
       3.038
              INT 21H, AH=17H - Rename File with FCB 3-31
       3.039
              INT 21H, AH=19H - Get Current Drive 3-31
       3.040
              INT 21H, AH=1AH - Set Disk Transfer Address 3-32
       3.041
              INT 21H, AH=1BH --- Get Default Drive Data 3-32
       3.042
              INT 21H, AH=1CH - Get Drive Data 3-33
       3.043
              INT 21H, AH=1FH — Get Default DPB 3-33
       3.044
              INT 21H, AH=21H — Random Read 3-34
       3.045
              INT 21H, AH=22H - Random Write 3-34
       3.046
              INT 21H, AH=23H — Get File Size 3-35
       3.047
              INT 21H, AH=24H - Set Random Record Number 3-36
       3.048
              INT 21H, AH=25H — Set Interrupt Vector 3-36
       3.049
              INT 21H, AH=26H — Create New Program Segment Prefix 3-37
       3.050
       3.051
              INT 21H, AH=27H — Random Block Read 3-37
```

APPENDIX A: Select Bibliography A-1

Introduction

The Programmer's PC Sourcebook is a collection of basic hardware and software information about personal computers (PCs). Why is this book necessary and in what ways will you find it useful?

- Suppose you need to pinpoint differences between IBM DOS 3.3 and MS-DOS 5.0. Normally you'd have to consult at least two references to make the comparison. With The Programmer's PC Sourcebook, you'll find the information you need in one place.
- Suppose you're tracing execution of a program on a single-step debugger, and your program hits a questionable call to a BIOS video function. You want to know what's going into the 6845 (video controller) chip's registers, what the BIOS function does, and what data the function requires. Again, the answer to all your questions is in this book.

Whatever you need to know about a PC—card sizes, cable connections, ROM BIOS routines, internal registers, DOS functions, and so on—you'll find the basic information here, with pointers to the pages in source references where you can check the finer details if you need to.

What's New in This Edition

The second edition of *The Programmer's PC Sourcebook* includes the latest developments in PC hardware and software. It is nearly 50 percent larger than the first edition, and it draws from a wider variety of sources. New material includes:

MS-DOS 5.0
MS Windows 3.0
CD-ROM Extensions
MS Mouse Driver 8.0 (including the BallPoint Mouse)
LIM 4.0 and new EMS abilities
EISA
Hayes Modem
VCPI
PS/2 Models 80, 90, and 95
80386, 80387, and Weitek 3167
i486 and Weitek 4167

Just like the first edition of *The Programmer's PC* Sourcebook, this edition:

- Acts as a primary source for most information contained in the IBM, Microsoft, and related technical references.
- Provides pointers to further information and to items too detailed for complete inclusion here.
- Organizes the information about personal computers in logical groups and presents the information in consistent ways.

Primary Source of IBM and Microsoft Information

Information in IBM, Microsoft, and other technical references often is spread over several volumes. The IBM personal-computer family has evolved in both hardware and software. Thus, you can find information about a particular BIOS function in as many as four or five places in the IBM references: the XT reference, the AT reference, the PS/2 references, the Options and Adapters reference, and the BIOS reference. And you can find information about similar functions for related products created by independent developers for compatible computers in additional references.

This book distills the important information from these technical and user references. As a result, when you look at a single BIOS-related table in this book, you see information that might have come from eight or nine different manuals. That is why this book is a "primary" source of information—it's the first source you should consult.

Pointers to Further Information

The information in this book always points to the original source data, and the book is fully cross-indexed so that every table also points to related tables elsewhere in the book. These pointers to related information come in the form of Source and See Also notes at the bottom of each table.

- The Source note gives the name and page number(s) of the primary source used in compiling the table.
- The See Also note gives the numbers and names of other tables in this book that contain related information you might want to consult.

Every effort has been made to ensure that the page numbers referenced in the Source notes are accurate. Technical documentation is updated from time to time, however, and therefore a little "page creep" may find its way into The Programmer's PC Sourcebook. Sometimes, developers retain page numbering in new editions (adding a page 1.1 and 1.2 between the original pages 1 and 2, for example); other times, they simply renumber an entire section when they make an update. Thus, the page numbers referenced here are exact if you are using a different edition, you'll find yourself in the correct section of the primary source.

Organization

To help you find information easily, as well as to help you see relationships among tables, this book is organized into three main parts:

- Part I includes miscellaneous general information.
- Part II includes software.
- Part III includes hardware.

Each part is further divided into one or more numbered sections, as you can see in the following abbreviated table of contents:

Part I: Miscellaneous Information

Section 1: General Information

Part II: Software

Section 2: DOS Commands, Utilities, and Summaries

Section 3: DOS Function Calls and Support Tables

Section 4: BIOS and DOS Extension Calls and Support

Section 5: Other Interrupts, CD-ROM, Mouse, and EMS Support

Section 6: Microsoft Windows

Part III: General PC Hardware

Section 7: Motherboards, Keyboards, Video Adapters, Peripherals, and Chips

Section 8: Connectors, Buses, and Pinouts

Within each section, all tables are numbered consecutively, and these numbers are used in the See Also cross-references

A word about the overall structure of this book: Programming for the BIOS and for hardware interrupts falls into the software part of the book because you're likely to encounter them while developing software. Physical items such as pins, switches, and registers are found in the hardware part of the book. The organization is based on decisions about ways you are likely to use the information, rather than upon strict hardware/software distinctions.

How Tables Are Presented

Here is a representative sample of a table:

As you can see, at the top of the table is its number and name in boldfaced type. They help you identify the table contents, with the number also serving as the cross-reference used elsewhere in the book.

If a table has been broken into subtables because of differences in implementation (as between the PC-AT and the PS/2), a subtable heading appears in bold italics immediately above each subtable.

Headings down the left side and across the top of a table are in italics to distinguish them from the information within the table. Where headings are grouped (bit numbers, for example, which are usually in groups of eight), a group header appears in bold italics immediately above the group.

Where groups of entries are related, the group appears in a single box with each item on a separate line within the box. Within entries, several abbreviations are consistently used:

| MSB | most significant bit or byte |
|----------|--|
| LSB | least significant bit or byte |
| LO | low order |
| НО | high order |
| 000 | a binary value of zero, zero, zero |
| 010 | a binary value of zero, one, zero |
| 0X1 | a binary value of zero, don't care, one |
| 1A (26) | the first value is hexadecimal; the parentheses contain the decimal equivalent |
| string | any group of text characters enclosed in quotes |
| char | character (a single byte of information) |
| int | integer number or interrupt |
| word | two bytes |
| dbl word | double word (four bytes) |
| | |

3.010. INT 21H MEMORY MANAGEMENT FUNCTIONS SUMMARY

| Function | Subfunction | Function Name | Use |
|----------|-------------|-------------------------|--|
| 48H | | Allocate Memory | Allocates requested amount of memory and returns address of memory block |
| 49H | | Free Allocated Memory | Frees memory previously allocated |
| 4AH | | Set Memory Block Size | Changes size of memory segment or amount of memory allocated |
| 58H | 00H | Get Allocation Strategy | Returns DOS memory allocation method |
| 58H | 01H | Set Allocation Strategy | Sets DOS memory allocation method |
| 58H | 02H | Get Upper-Memory Link | Specifies whether programs can allocate upper memory |
| 58H | 03H | Set Upper-Memory Link | Links or unlinks upper-memory area |

Basic Programming language

A special form of table, like the one shown below, is used for any function or interrupt call that uses registers to pass information.

In such cases, the table shows exact register use. If a register is not used by a function or call, it is blank, and you can assume that it is left unchanged by the function. Destroyed registers are explicitly identified in the tables. Presenting the register use as a consistently formatted table helps you visualize exactly how the function or call uses the registers.

Below each table is a collection of miscellaneous information that can include:

- Footnotes, which give specific information about individual entries in the table.
- Legend, which is a key to codes used in some tables.
- Version, which tells you about differences in versions or between products.

- Note, which gives general information about or exceptions to entries in the table.
- Source, which identifies the primary sources of the data in the table.
- See Also, which refers you to related tables elsewhere in the book.

The Impact of Evolving Software and Hardware

PC software, and to a lesser extent, hardware, is constantly evolving. To reflect changes that have occurred since publication of the first edition of The Programmer's PC Sourcebook, sections have been updated to reflect new software versions. This updating affects Section 3, in particular, where function names have been changed to reflect MS-DOS 5.0 and tables have been organized around MS-DOS 5.0 structures. To the extent possible, however, historical information has been retained throughout this book and equivalent features of earlier software versions have been identified.

| | C | 192 | 193 | 194 | 195 | 196 | 197 | 198 | 199 | 200 | 201 | 202 | 203 | 204 | 205 | 206 | 207 |
| | D | 208 | 209 | 210 | 211 | 212 | 213 | 214 | 215 | 216 | 217 | 218 | 219 | 220 | 221 | 222 | 223 |
| | E | 224 | 225 | 226 | 227 | 228 | 229 | 230 | 231 | 232 | 233 | 234 | 235 | 236 | 237 | 238 | 239 |
| | F_ | 240 | 241 | 242 | 243 | 244 | 245 | 246 | 247 | 248 | 249 | 250 | 251 | 252 | 253 | 254 | 255 |

To Use This Table:

To convert a one-byte (two-digit) hexadecimal value to decimal, locate the most-significant hex digit in the left-most column. Follow that row across to the right until it intersects with the column that has the least-significant hex digit in its top cell. The value at the intersection is the decimal equivalent of the hex byte. For example, to convert 44 hex to decimal, find the intersection of the row containing A in its leftmost cell with the column containing A in its top cell. The decimal value of 44 hex is 164.

| | 1 | 2 | 3 | 4 | < two-byte hex value digit positions |
|-------------------------------|-------------------|----------------------|---|---------------|--------------------------------------|
| | | | | | |
| Position 1 | Posit | | | .Posit | |
| Hex Dec 0 0 1 4096 | Hex 0 | Dec 0 256 | ĺ | Hex 0 | Dec |
| 2 8192 3 12288 | 2 3 | 512 768 | | 2 | 32 48 3 3 3 |
| 4 16384 5 20480 | 5 | 1024 1280 | | <u>4</u> 5 | 64 4 4 80 5 5 |
| 6 24576 7 28672 8 32768 | - 6 - 7 - 8 | 1536 1792 2048 |] | 6 7 8 | 96 6 6 112 7 7 128 8 8 |
| 9 36864 A 40960 | 9 A | 2304 2560 | | 9 A | 144 9 9 160 A 10 |
| B 45056 C 49152 D 53248 | B C | 2816 3072 3328 | l | B C D | 176 B 11 192 C 12 208 D 13 |
| E 57344 F 61440 | Ē | 3584 3840 | | Ē | 224 E 14 240 F 15 |

To Use These Tables:

To convert a two-byte (word) hexadecimal value to decimal, find the value associated with each hex digit place in the above table and add the numbers together. For example, the hex value A5D7 would be equal to 40960 (the A value) plus 1280 (the 5 value) plus 208 (the D value) plus 7, or 42455.

See Also:

1.06. Binary Number Conversions
 1.09. Octal to Hexadecimal Number Conversion
 1.12. Decimal to Hexadecimal Number Conversion

See Also:

1.02. HEXADECIMAL TO BINARY NUMBER CONVERSION

| NIbbl | e Value | | | |
|-------|---------|-----|-----|--------|
| Hex | Binary |] | Hex | Binary |
| 0 | 0000 | 1 | 8 | 1000 |
| 1 | 0001 | I I | 9 | 1001 |
| 2 | 0010 |] | Α | 1010 |

To Use This Table:

To convert a hexadecimal byte value to octal, find the value in one of the left columns and read the corresponding octal value in the column to the right. For example, a hexadecimal value of 84 results in an octal value of 204.

To Use These Tables:

To add two hexadecimal nibbles (single digits), locate one of the digits in the leftmost column. Follow its row across to the right until you reach the column containing the other digit in its top cell. The value at the intersection is the sum of the two digits. The top table gives the sum in hexadecimal, the bottom table gives the same number in decimal. For example, the sum of A and 6 hex is 10 hex and 16 decimal.

To Use These Tables:

To add two hexadecimal bytes (double digits), locate the first number of one of the digits in the leftmost column. Follow its row across to the right unit you reach the column containing the first number of the other digit in its top cell. The value at the intersection is the sum of the first two digits. The top table gives the sum in hexadecimal, the bottom table gives the same number in decimal. For example, the sum of A0 and 60 hex is 100 hex and 256 decimal. If you are adding hexadecimal bytes that don't end in 0 (e.g., B4 + A6), first look up the result for the least-significant digits (4 $^{\circ}$ $^{\circ}$ A $^{\circ}$ A hex, in add this value to the result for the most-significant digits (80 + A0 = 150 hex, so B4 + A6 = 150 + A hex, or 15A). Remember to carry if necessary (8 + B = 16, so B8 + AB = 166).

To Use These Tables:

To multiply two hexadecimal nibbles (single digits), locate one of the digits in the leftmost column. Follow its row across to the right until you reach the column containing the other digit in its top cell. The value at the intersection is the product of the two digits. The top table gives the product in hexadecimal, the bottom table gives the same number in decimal. For example, the product of A and 6 hex is 30 hex and 60 decimal.

is 3C nex and 6

To Use This Table:

To convert a binary byte to decimal, hex, or octal, find the binary byte in one of the leftmost columns, and read the converted value in the appropriate column in the same row. For example, the octal equivalent of binary 0000 1110 (first column) is 016 (fourth column).

| | | | |

To Use This Table:

To convert a binary value to decimal, find the binary value in one of the left columns and read the corresponding signed decimal value in the column to the right. For example, the signed decimal equivalent of 1111 1000 is -8.

To Use This Table: To convert an octal value to decimal, find the octal value in one of the left columns and read the corresponding decimal value in the column to the right. For example, 067 octal is 55 decimal.

Note: Octal is rarely used for values greater than 128 decimal.

To Use This Table:

To convert an octal value to binary, find the octal value in one of the left columns and read the corresponding binary value in the column to the right. For example 057 octal is 0010 1111 binary.

Note:

Octal is rarely used for values greater than 128 decimal.

To Use This Table:

To convert a decimal byte value, find the decimal byte value in one of the left columns and read the corresponding binary value in the column to the right. For example, 43 decimal is 0010 1011 binary.

To Use This Table:

To convert a decimal value to hexadecimal, find the decimal value in one of the left columns and read the corresponding hexadecimal value in the column to the right. If you are converting a decimal number larger than 100, you may have to perform several steps, adding the results together. For example, to convert 12345 into hex, first obtain the hex value of decimal 10000 (2710H), then add this to the value for 2000 decimal (120H). Then add this to the value for 300 decimal (12CH), then add this to the value for 45 decimal (2DH). The result is 3039H. Remember that the numbers you are adding are in hexadecimal.

To Use This Table:

To convert a decimal value to cetal, find the decimal value in one of the left columns and read the corresponding octal value in the column to the right. If you are converting a decimal number larger than 100, you may have to perform the conversion in steps, adding the results together. For example, to convert 12345 into octal, lirst obtain the octal value of decimal 10000 (23420), then add this to the value for 2000 decimal (3720), then add this to the value for 300 decimal (454), then add this to the value for 45 decimal (55). The result is 30071. Remember that the numbers you are adding are in octal.

To Use This Table:

To find the two's complement of a binary value, find the binary value in one of the left columns and read the corresponding two's complement value in the column to the right. For example, the two's complement of 1110 1100 is 0001 0100.

1.15. COMMON 8086 FAMILY DATA FORMATS

Sign Bit (if used)

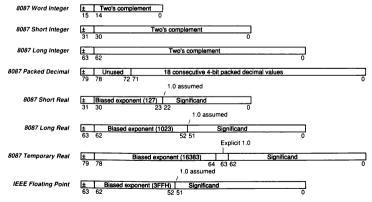

Note: Numbers in boxes are the bit numbers; note that the bit numbering starts with the least-significant bit labeled zero.

| Integer Storage Abilities | Smallest Integer Value | Largest Integer Value |
|---------------------------|------------------------|-----------------------|
| NIbble Binary 3 0 | 0 | 15 |
| Byte ± Two's complement 0 | -128 | 127 |
| Word | -32,768 |] 32,767 |
| Double Word | -2,147,483,648 | 2,147,483,647 |

Numbers beneath boxes indicate bit numbers (the high number is the most significant).

1.16. COMMON NUMERIC DATA FORMATS

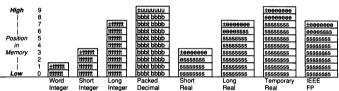

1.16. Common Numeric Data Formats (continued)

- Notes:
- Numbers beneath boxes indicate bit numbers (high=most significant)
 A bit value of 1 in the sign position (±) indicates the value is negative.
- Exponent specifies the power of two by which the significand must be raised to obtain the value of a real number.
- Exponent specifies the power of two by which the significant most
 Significand specifies a binary value to be raised by the exponent.
- Note that some data formats are "normalized" (i.e., have an assumed leftmost bit of 1). Also, note that the decimal
 point in real numbers will be to the right of the leftmost digit in the significand.
- . The IEEE floating-point format has an assumed high-order bit of 1 (i.e., it is "normalized").
- Note that the exponent for IEEE floating point numbers is "biased" by an implementation-dependent amount.
 For the 8087, the real exponent = exponent -1023.

Layout of 8087 Data in Memory

Legend:

b=binary digit e=exponent bit s=significant bit t=two's complement ±=sign bit u=unused bit

To Use This Table:

This table shows where each bit position is stored in memory, and what it is used for. Each letter or symbol in the boxes represents one bit (lower right is least significant, upper left is most significant); each row represents one byte in memory.

Numeric Range Acceptable to Data Format

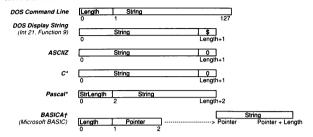

| | Range | Precision | Smallest Value Accepted | Largest Value Accepted |
|---------------------|----------|-----------|----------------------------|---------------------------|
| 8087 Word Integer | 10^4 | 16 bits | -32,768 | 32.767 |
| 8087 Short Integer | 10^9 | 32 bits | -2,147,483,648 | 2.147.483.647 |
| 8087 Long Integer | 10^18 | 64 bits | -9,223,372,036.854,775.808 | 9,223,372,036,854,775,807 |
| 8087 Packed Decimal | 10^18 | 18 digits | | (10^18)-1 |
| 8087 Short Real | 10^±38 | 24 bits | 8.43 x 10^-37 | 3.37 x 10^38 |
| 8087 Long Real | 10^±308 | 53 bits | 4.19 x 10^-307 | 1.67 x 10^308 |
| 8087 Temporary Real | 10^±4932 | 64 bits | 3.4 x 10^-4932 | 1.2 x 10^4932 |
| IEEE Floating Point | | | 4.19 x 10^-307 | 1.67 x 10^308 |
| MASM Long Real | | | NA | NA) |
| MASM Short Real | | | NA | NA NA |

| 4 | 04 | 0000 0100 | EOT | End of transmission | Marks end of transmission session |
| 5 | 05 | 0000 0101 | ENQ | Inquiry | Request for identification or information |
| 6 | 06 | 0000 0110 | ACK | Acknowledgment | "Yes" answer to queries or "ready for next transmission"/ used in |
| 1 | | | | | asynchronous protocols for timing |
| 7 | 07 | 0000 0111 | BEL | Bell | Rings bell or audible alarm on terminal |
| 8 | 08 | 0000 1000 | BS | Backspace | Moves cursor position back one character |
| 9 | 09 | 0000 1001 | HT | Horizontal tab | Moves cursor position to next tab stop on line |
| 10 | 0A | 0000 1010 | LF | Line feed | Moves cursor position down one line |
| 11 | 0B | 0000 1011 | VT | Vertical tab | Moves cursor position down to next "tab line" |
| 12 | 90 | 0000 1100 | FF | Form feed | Moves cursor position to top of next page |
| 13 | 9 | 0000 1101 | CR | Carriage return | Moves cursor to left margin |
| 14 | 0E | 0000 1110 | | Shift out | Next characters do not follow ASCII definitions |
| 15 | 0F | 0000 1111 | SI | Shift in | Next characters revert to ASCII meaning |
| 16 | 10 | 0001 0000 | DLE | Data link escape | Used to control transmissions using "escape sequences" |
| 17 | 11 | 0001 0001 | DC1 | Device control 1 | Not defined; normally used for ON controls; usually user defined |
| 18 | 12 | 0001 0010 | DC2 | Device control 2 | Not defined; normally used for ON controls; usually user defined |
| 19 | 13 | 0001 0011 | DC3 | Device control 3 | Not defined; normally used for OFF controls; usually user defined |
| 20 | 14 | 0001 0100 | DC4 | Device control 4 | Not defined; normally used for OFF controls; usually user defined |
| 21 | 15 | 0001 0101 | NAK | Negative acknowledgment | "No" answer to questions or "errors found, retransmit"/used in |
| | | | | | asynchronous protocols |
| 22 | 16 | 0001 0110 | SYN | Synchronous idle | Sent by synchronous devices when idle to insure sync |
| 23 | 17 | 0001 0111 | ETB | End of transmission block | Marks block boundaries in transmission |
| 24 | 18 | 0001 1000 | CAN | Cancel | Indicates previous transmission should be disregarded |
| 25 | 19 | 0001 1001 | EM | End of medium | Marks end of physical media, as in paper tape |
| 26 | 1A | 0001 1010 | SUB | Substitute | Used to replace a character known to be wrong |
| 27 | 1B | 0001 1011 | ESC | Escape | Marks beginning of an Escape control sequence |
| 28 | 1C | 0001 1100 | FS | File separator | Marker for major portion of transmission |
| 29 | 1D | 0001 1101 | GS | Group separator | Marker for submajor portion of transmission |
| 30 | 1E | 0001 1110 | | Record separator | Marker for minor portion of transmission |
| 31 | 1F | 0001 1111 | US | Unit separator | Marker for most minor portion of transmission |

Note:

- ASCII control codes are sometimes used to "formalize" a communications session between communications devices.
 DC1, DC2, DC3, DC4, FS, GS, RS, and US all have user-defined meanings, and may vary in use between sessions or devices.
 DC4 is often used as a general "stop transmission character."
 Codes used to control curvor position may be used to control print devices, and move the print head accordingly. Not all devices support the full set of positioning codes, however.

^{*}ASCII defines characters 0:31 to be control characters (or non-printing characters). On many systems the characters will display as shown and you can use the control sequence shown to enter these values from the keyboard.

Note: IBM does not use the ASCII codes for all characters, using, for example, the lower 32 characters for graphics.

1,22. IBM ASCII Character Set (continued)

Note:

The line-drawing characters are given arbitrary names in this table in this manner: the leftmost component is named first, followed by the word "to;" followed by the rightmost component. Thus, if we were naming the upper-left corner of a single-line box, it would be "1 to 1 upper left." If the left side of the box were double lined, it would be "2 to 1 upper left."

^{*}Alt + ; is listed only in IBM Technical Reference Personal Computer XT and Portable Personal Computer. The technical reference lists only one function for all three codes.

Note: Extended codes are preceded by a byte of 00H. For example, 00H, 81H means Alt and Zero were held down.

1.26. DIGIT POSITIONS IN COMMON BASES

| Digit | Position | Value |
|-------|----------|-------|
| | | |

| Base | Name | 6th Pos. | 5th Pos. | 4th Pos. | 3rd Pos. | 2nd Pos. | 1st Pos. |
|------|-------------|----------|----------|----------|----------|----------|----------|
| 2 | binary | 32 | 16 | | _ 4 | 2 | 1 |
| 8 | octal | 32768 | 4096 | 512 | 64 | 8 | 1 |
| 10 | decimal | 100000 | 10000 | 1000 | 100 | 10 | 1 |
| 16 | hevedecimal | 1048576 | 65536 | 4096 | 256 | 16 | 1 |

Note:

The first digit position is the least significant.

1.27. POWERS OF TWO

| Power | Value | Common Definitions and Usage |
|-------|------------|--|
| 2^1 | 2 | (1 bit may have 2 possible values) (2 bytes = word) |
| 2^2 | 4 | (4 bits = nibble, BCD Digit) (4 bytes = double word) |
| 2^3 | 8 | (8 bits = byte, ASCII Character) |
| 2^4 | 16 | (16 bits = word, Near Address) (16 bytes = paragraph) |
| 2^5 | 32 | (32 bits = double word, Far Address) |
| 2^6 | 64 | |
| 2^7 | 128 | |
| 2^8 | 256 | (1 byte may have 256 possible values) (256 bytes = page) |
| 2^9 | 512 | |
| 2^10 | 1,024 | (1,024 bytes = kilobyte) |
| 2^11 | 2,048 | |
| 2^12 | 4,096 | |
| 2^13 | 8,192 | |
| 2^14 | 16,384 | |
| 2^15 | 32,768 | |
| 2^16 | 65,536 | (65,536 bytes = segment) |
| 2^17 | 131,072 | |
| 2^18 | 262,144 | |
| 2^19 | 524,288 | |
| 2^20 | 1,048,576 | (1,048,576 bytes = megabyte) |
| 2^21 | 2,097,152 | |
| 2^22 | 4,194,304 | |
| 2^23 | 8,388,608 | |
| 2^24 | 16,777,216 | |
| 2^25 | 33,554,432 | |

Note:

2^15 means 2 raised to the 15th power.

1.28. ASCII AND INTERNATIONAL SORT ORDERING

- In ASCII sort ordering, lower numbered ASCII characters appear before higher numbered ones, thus: -AII uppercase characters appear before lowercase ones. -Characters with diacritical marks come after all other letters.

ASCII sort ordering would treat the alphabet like this:

- In International sort ordering ASCII sort order is changed as follows:
 -Characters are sorted by alphabetical position: A and a are equal and come before B.
- Characters with discritical marks are expanded accordingly: unificated a becomes as for sort ordering, 6 becomes ss, etc.

 -Lowercase characters are applied first; for example, deJesus appears before Dejesus.
- Norwegian, Danish, Swedish, and Finnish a, A, and umlauts are placed at the end of the regular alphabet for those countries.

| | | a treat the alpha | bet like this. |
|------------|------------------|-------------------|----------------|
| ASCII Code | Character | ASCII Code | |
| 65 | A | 128 | Ç |
| 66 | В | 129 | ٥ |
| 67 | С | 130 | é |
| 68 | D | 131 | â |
| 69 | Ē | 132 | ä |

| | TRUE _ | FALSE | TRUE |
| | ALSE | TRUE | TRUE |
| | ALSE | FALSE | FALSE |

To Use This Table:

The resulting value is read by finding a row in which the condition or conditions you are looking up are met, and then reading the result in the rightmost column of that row.

Section 2

DOS Commands, Utilities, and Summaries

DOS Commands

- 2.01 DOS Command Summary
- 2.02 Exit Codes Returned by DOS Commands
- DOS Extended Error Messages 2.03
- 2.04 DOS Parse Error Messages

DOS Command Utilities

- 2.05 Editing DOS Command Lines
- 2.06 Batch File Commands
- 2.07 CONFIG.SYS Commands and Default Settings
- 2.08 PROMPT Special Characters
- 2.09 PROMPT ANSI Control Strings
- 2.10 PROMPT ANSI Display Attribute Strings
- 2.11 Device Driver Parameters

DOS Utilities

- 2.12 **DEBUG Command Summary**
- 2.13 **EDLIN Command Summary** 2.14 LIB Operators Summary
- 2.15 LINK Parameters Summary
- 2.16 DOSSHELL Program Startup Options
- DOSSHELL Program Special Key Assignments 2.17

DOS Disk Layouts

- 2.18 Directory Entries
- 2.19 File Attribute Byte
- 2.20 Date/Time Formats
- 2.21 **FAT Layouts**
- 2.22 Disk ID Bytes
- 2.23 Disk Boot Record Layout
- 2.24 Disk Partition Table Layout
- 2.25 Floppy Disk Format Summary
- 2.26 IBM Hard Disk Format Summary

DOS File Layouts

- 2.27 EXE File Header
- 2.28 COM Program Layout

- 2.29 COM versus EXE File Differences
 - 2.30 Font File (Code Page) Layout
 - 2.31 Operating System Files Summary
 - 2.32 Included Command Files Summary
 - 2.33 Common File Types (Extensions)

Other

- 2.34 Typical DOS Memory Usage
- 2.35 Allowable Characters in Filenames
- 2.36 Filename Separator Characters

2.01. DOS COMMAND SUMMARY

| Command | | | Function | Syntax |
|------------|-------|-----|---------------------------------------|--|
| APPEND | ext | Yes | Sets a search path for data files | APPEND [d:]path[:[d:][path]][/parms] |
| | | 1 | I . | /e stores appended dirs in environment |
| [| - 1 | 1 | 1 | /x or /x:on extends appending to function 4BH, 11H, 4EH ops |
| | 1 | | 1 | /x:off turns off extended function operations |
| | 1 | 1 | | /path:on - files having drives or paths will be processed |
| | | — | | /path:off files having drives or paths will not be processed |
| ASSIGN | ext | Yes | Routes disk I/O from one drive | ASSIGN [x[:]=y[:] []] |
| | - 1 | 1 | to another drive | x current drive |
| | | 1_ | | y new drive |
| ATTRIB | ext | Yes | Sets or displays file attributes | ATTRIB (±r](±a)(±s)(±h)(d:)[path)filespec[/s] |
| | | 1 | | +r sets read-only attribute of file |
| | - 1 | 1 | | -r removes read-only attribute of file |
| | 1 | | | +a sets archive attribute of file |
| | 1 | | | -a removes archive attribute of file |
| | 1 | 1 | | +s sets system file attribute† |
| | 1 | 1 | | -s removes system file attribute† |
| | | J | l | +h sets hidden file attribute† |
| | | 1 | | -h removes hidden file attribute† |
| | 1 | 1 | | /s process all subdirectories to path |
| BACKUP | ext | Yes | Backs up one or more files from one | BACKUP d1:[path][filespec] d2:[/parms] |
| | 1 | | disk to another | d1 source |
| | 1 | 1 | | d2 destination |
| | 1 | 1 | l | /s backs up subdirectories |
| | 1 | 1 | l | /m backs up only files that have changed since last backup |
| | ı | 1 | l | /a adds files to existing backup set |
| | 1 | 1 | l | /1:size - formats target disk; size=160,180,320,360,720,1.2,1.44 |
| | 1 | 1 | l | //:size - formats target disk; size=160,180,320,360,720,1.2,1.44 //d:date backs up files created/modified on or after date specified |
| | | | ĺ | |
| | | 1 | 1 | /t:time backs up files created/modified on at or after time specified |
| | + | | | /L[:[d:][path]filespec] places backup log in file specified |
| BREAK | int | Yes | Defines status of control break check | BREAK (ONIOFF) |
| CHCP* | int | Yes | Displays or changes the code page | CHCP [number] |
| | | | DOS uses | number = a valid code page defined by COUNTRY in CONFIG.SYS |
| CHDIR (CD) | int | Yes | Sets or displays current path | CHDIR (d:)[path] |
| | 1 | ŀ | | CHDIR [] |
| | Į. | 1 | | CD [d:][path] |
| | ı | | | CD [] |
| | | | | parent directory |
| CHKDSK | ext | No | Analyzes disk and FAT and produces | CHKDSK [d:][[path[filespec]]/parms] |
| | | ł | a disk and memory status report | /f fixes errors reported on disk |
| | 1 | I | , , | N - displays names of all files as disk is checked |
| CLS | int | Yes | Clears display screen | CLS |
| COMMAND | ext | | Starts a secondary command processor | COMMAND [[d:]path][ctty-dev][/parms] |
| | 1 | | | ctty-dey allows you to specify a different device for input and output |
| | | l | | /e:number specifies environment size, in bytes (160 to 32,768) |
| | | l | | /p keeps secondary command processor in memory |
| | | l | | /c string - executes commands specified by string, then returns |
| | | | | to primary command processor |
| COMP | ext | Yes | Compares contents of files | COMP [[d: path][filespec1][[d: path][filespec2][/parms] |
| ONIT | l ex(| Tes | Compares contents of lifes | |
| | 1 | | | /d display differences in decimal† |
| | 1 | | | /a display differences in ASCII characters† |
| | 1 | 1 | | A display number of line where difference occurs† |
| | 1 | | | /n=number compares number of lines specified† |
| | | | | /c performs comparison regardless of case† |
| COPY | int | Yes | Copies a file or set of files | COPY [/parms][d:][path]filespec[/parms] [d:][path][filespec][/parms] |
| | 1 | ' | | /v verifies that sectors on target disk were written correctly |
| | 1 | | 1 | /a copies ASCII files up to end-of-file mark |
| | 1 | | | /b copies binary files using size of file in directory |
| | 1 | 1 | | NOTE: first filespec is source, second is target; multiple files may be |
| | 1 | | | copied into a single file by specifying multiple sources with + sign |
| TTY | int | Yes | Changes device from which you | CTTY devicename |
| 2111 | 1 "" | | | |
| | 1 | | issue commands | devicename = AUX, COM1, COM2, COM3, COM4, or CON |
| | + | ١ | | to return to standard I/O |
| ATE | int | | Sets or displays date | DATE [mm-dd-yy] |
| EBUG | ext | No | Starts debug program | DEBUG [[d: [path]filespec [testfile-parms]] |
| ELOLDOS | 1 | | Deletes all old versions of DOS from | DELOLDOS |
| | | | your computer | 1 |
| | | | | |
| DEL | int | Yes | Deletes specified file or files | DEL [d:][path]filespec(/parm) /p prompts prior to deletion |

| Command | Type | | Function | Syntax |
|-----------|------|-----|---|---|
| DIR | int | Yes | Lists directory entries | OIR [d:][ash]filespec[lysums] |
| DISKCOMP | ext | No | Compares contents of two disks | DISKCOMP [d1: [d2:]]/parms] /1 compares only first side of disk /8 compares only first 8 sectors per track |
| DISKCOPY | ext | No | Copies a disk | DISKCOPY [d1: [d2:][/parm] d1 = source d2 - target / - verifies copy is correct† // - copies only first side of disk |
| DOSKEY† | ext | Yes | Starts resident DOS command editor | DOSKEY [iparms][macroname-[lext]] //einstall - installs new copy of DOSKEY //bustze-size - specifies DOSKEY buffer size (256-512 bytes) //macros - displays list of DOSKEY macros //history - displays list of commands stored in memory //nised or /oversitike - specifies byting mode |
| DOSSHELL* | ext | Yes | Starts DOS file manager shell in IBM DOS | For syntax, see 2.16 DOSSHELL Program Startup Options |
| EDIT† | ext | | Starts DOS file editor | EDIT [id:[path]filespec] [/parms] /b displays editor in black and white /g uses last screen updating for CGA monitors /h displays maximum lines possible for current monitor /nohl - enables 8-color monitors to be used |
| EDLIN | ext | Yes | Starts line-oriented DOS file editor | EDLIN [d:][path]filespec [/b] /b Ignore end-of-file marker |
| EMM386† | ext | No | Enables/disables EMS for 386-equipped machines | EMM386 [on]off auto][w=on]off] [y=path] w enables or disables Weitek coprocessor support y specifies location of EMM386.EXE file |
| ERASE | ext | Yes | Deletes specified file or files | ERASE [d:][path]filespec[/parm] /p = prompts prior to deletion* |
| EXE2BIN* | ext | Yes | Converts .exe files to binary format | EXE2BIN [d:][path][filespec1 [d:][path][filespec2] filespec1 input file filespec2 output file |
| EXIT | int | | Exits COMMAND.COM and returns to previous level, if one exists | EXIT |
| EXPAND† | ext | | Expands compressed DOS 5.0 file | EXPAND (d:)[path filespect [[d:][path filespec2[]] destination filespec1 – first file to expand filespec2 – second file to expand destination – drive or filespec for expanded files or file |
| FASTOPEN | ext | | Keeps location of opened files on disk or in memory | FASTOPEN d:[=numberfiles][/parms] FASTOPEN d:[=(numberfiles].numberextents])[/parms] FASTOPEN d:[=([numberfiles],numberextents])[/parms] /x - places file cache in expanded memory |
| FC* | ext | | Compares two files or sets of files and shows differences | FC [parms[d:]path]filespec: [d:]path]filespec: /a - abtreviates ASCII output comparison /b - forces binary comparison (precludes other /parms) /c - ignores case of letters /k - compares in ASCII mode /k number - sets line buffer to number of lines /h - displays line number in ASCII comparisons /h - dosprit expard tabs to spaces /w - compresses white space in comparison /mumber - specifies number of lines that must match after difference |
| FDISK | ext | No | Creates or changes disk partitions | FDISK |
| FIND | ext | | Searches for a string of text in a file or set of files | FIND [parms] 'string' [[ci]path]lilesped]] /c - displays number of lines that contain a match /i - specifies search is not case sensitive† /in - numbers lines /v - displays all lines not containing string |

| Command | Туре | Net | | Syntax |
|----------------|-------|----------|--|---|
| FORMAT | ext | No | Formats disk for use | FORMAT d:[/parms] |
| | l l | | | /1 formats disk as single sided |
| | l . | 1 | | /4 formats disk as 5.25*, 360K, double-sided in 1.2MB drive |
| | i . | 1 | | /8 formats 8 sectors per track |
| | | 1 | 1 | /b formats disk leaving space for operating system |
| | 1 | 1 | l . | /s formats disk and copies operating systems files |
| | ı | | 1 | /q deletes FAT and root directory of prey formatted diskt |
| | ı | | 1 | /u - unconditional format (destroy all old data)† |
| | i | ı | 1 | Attracks formats disk to number of tracks specified |
| | l | ľ | 1 | /n:sectors formats disk to number of sectors specified |
| | l | | | /v:label writes volume label on disk |
| | | | | /f:size - specifies disk size (160.180.320.360.720.1.2.1.44) |
| GRAFTABL | ext | Yes | Loads special character data into memory | GRAFTABL inumberi |
| GNAI IADE | OAL | '** | Loads apecial character data into memory | GRAFTABL /STAITUS] |
| | ı | l . | | GRAFTABL [7] |
| | l | i | | number = 437, 850, 860, 863, or 865 |
| GRAPHICS | ext | Yes | Sets system to print graphic displays | GRAPHICS type [profile] [/parms] |
| GHAPHICS | ext | 162 | | type = COLOR1, COLOR4, COLOR8, GRAPHICS, |
| | l | ı | when using a color or graphics monitor | |
| | ı | i | adapter | GRAPHICSWIDE, THERMAL, HPDEFAULT†, DESKJET†. |
| | ı | 1 | I | LASERJET†, LASERJETII†, PAINTJET†, QUIETJET†, |
| | l | l | 1 | QUIETJETPLUS†, RUGGEWRITER†, RUGGEDWRITERWIDE†, |
| | l | ı | I | THINKJET† |
| | l | i | l | profile = file containing info on supported printers (graphics.pro) |
| | ı | l | I | /b prints background in color |
| | ı | 1 | İ | /lcd prints using LCD aspect ratio |
| | l | 1 | | /printbox:id selects printbox size; id must match profile |
| | l | l | | /r prints black and white |
| HELPT | ext | Yes | Provides online info about command | HELP (command) |
| JOIN | ext | No | Logically connects drives | JOIN [d1: [d2:]path] |
| JOH | - OAI | 140 | Logically confidets unives | JOIN d: /D (to disconnect a previous JOIN) |
| KEYB | ext | Yes | Loads replacement keyboard driver | KEYB[xx[,[yyy][,[d:][path]filespec]]][/parms] |
| NETB . | ext | 165 | | |
| | | | if specified, or displays current setting | xx = keyboard code |
| | | ı | i | yyy = code page |
| | | ı | | /e specifies enhanced keyboard is installed† |
| | | <u> </u> | | number = 437, 850, 860, 863, or 865 |
| LABEL | ext | No | Creates or changes volume label | LABEL [d:][label] |
| LOADFIX† | | | Ensures that a program is loaded above | LOADFIX (d:)[path] filename [program-parameters] |
| | | | the first 64K of conventional memory | |
| LOADHIGH† (LH) | int | Yes | Loads program in upper memory | LOADHIGH [d:][path]filespec [parameters] |
| MEM. | ext | Yes | Displays amount of used & free memory | MEM [/PROGRAM] (displays programs loaded in memory) |
| | | l | | MEM [/CLASSIFY] (displays status of programs in conv and upper mem) |
| | | ı | | MEM [/DEBUG] (displays programming information and program) |
| MIRROR† | ext | Yes | Starts MIRROR, which records disk info | MIRROR [d:[]][/1] [/tdrive[-entries][]] |
| | • | | The state of the s | MIRROR [/u] |
| | | | | MIRROR [/partn] |
| | | | | Adrive[-entries] loads TSR deletion-tracking program |
| | | | | |
| | | | | /1 - retains only latest Info about disk |
| | | | | /u unloads deletion-tracking program |
| | | L. | | /partn saves partition Information |
| MKDIR (MD) | Int | | Creates subdirectory | MKDIR [d:]path |
| MODE | ext | | Sets printer specifications | MODE LPT#[:][c][,[i][,r]] |
| - 1 | | | 1 | MODE LPT#[cols=c][lines=f][retry=r] |
| | | | | c number of characters per line (80 or 132) |
| | | | | I vertical spacing (6 or 8 lines per inch) |
| | | | | # - printer number |
| | | | | |
| | | | la | r - retry action (E=error, B=busy, R=ready, none=no retry) |
| | | | Reports device status | MODE [device][/STA[TUS]] |
| | | | Sets video display mode | MODE display, n |
| | | | ! | MODE [display],shift[,test] |
| | | | | MODE con[:][cols=m][lines=n] |
| | | | | MODE Inl.ml.Tl (DOS 3.3 and earlier) |
| | | | | n – number of lines on display (25, 43, or 50) |
| | | | | m characters per line (40 or 80) |
| | | | | |
| | | | | |
| | | | | shift L for shift left or R for shift right (CGA only) |
| | | | | |

| Sets serial port specifications | | _ | | F | |
|--|-------------|---------------|-----|--|--|
| MODE COM# baud-bloats-dijstos-pijparty-pijretry-y-j b - first two digits of baud rate (Bits source implies all digits red d - number of databits (5, 6, 7, or 8) P - sparrorous port (1, 2, 3 or 4) P - partly of N (none), O (odd), E (even), M (mark), S (Space) s - number of stop bits (1, 15, or 2) r - retry action (E-error, 8-busy, R-ready, none-no retry) MODE LPTS-j-COM# P - port number (1, 23, or 4) MODE conf) rate - foliapy: Prepares code pages Prepares code pages Prepares code pages Prepares code pages Prepares code page Prepares code | Command | Type | Net | Function | Syntax |
| B - first two digits of baud rate (RM source Implies all digits re d - number of datables (S. 6, 7 or 8) # - asyncronous port (1, 2, 3 or 4) | | | | Sets serial port specifications | MODE COM#[: b[,[p][,[d][,[s][,r]]]] |
| d - number of datablas (5, 6, 7, or 8) | 1 | | l | | MODE COM# baud=b[data=d][stop=s][parity=p][retry=r] |

| environment equal to another string | | | | environment equal to another string | |

DOS Commands 2-7

2.01. DOS COMMAND SUMMARY (continued)

| Command | Type | Net | Function | Syntax |
|-----------|------|-----|---|--|
| SETVER† | ext | Yes | Sets version number DOS reports | SETVER (d:path)[filespec n.nn] SETVER (d:path)[filespec (/delete [/qulet]] SETVER (d:path) filespec name to add to version table |
| | | | | n.nn version number to display /delete deletes version entry for specified program /dulet hides message displayed during deletion |
| SHARE | ext | Yes | Loads file sharing and locking support | / Action of the control of the contr |
| SORT | ext | Yes | Sorts stdin data, sends to stdout | Source SORT |
| SUBST | ext | No | Creates drive specifier for drive or path | SUBST (d1: d2:path) SUBST d: /d / d deletes a virtual drive |
| SYS | ext | No | Copies DOS onto disk | SYS [d1:][path] d2: d1 location of system files d2 destination of system files |
| TIME | int | Yes | Sets, changes, or displays time | TIME [hours:minutes[:seconds[.hundredths]]] |
| TREE | ext | Yes | Graphically displays directory paths | TREE [d:][/parms] /a uses available graphic characters /f displays names of all files in directory |
| TYPE | int | Yes | Displays contents of file on stdout | TYPE (d:)[path]filespec |
| UNDELETE† | ext | | Restores file previously deleted | UNDELETE [[d]]path liespec [/istl/ail] [/dos/dt] //ist - lists deleted files /all - recovers files without prompt /dos - recovers only files deleted by DOS /dt - recovers only files listed as deleted by MIRROR |
| UNFORMAT† | ext | No | Restores disk erased by FORMAT command or restructured by RECOVER | UNFORMAT d: [/i] UNFORMAT (: [/i] [/i] [/i] [/i] [/i] UNFORMAT [/i] [/i] [/i] [/i] /- verifies file created by MIRROR agrees with system into on disk //i - uniformats a disk without using MIRROR file //i - lists every file found //ii - lists every file found //ii - sends output messages to printer //partn - restores corrupted earlition table |
| VER | int | Yes | Displays DOS version number | VER |
| VERIFY | int | | Sets verify after write status | VERIFY [ON]OFF] |
| VOL | int | | Displays volume label | VOL [d:] |
| КСОРУ | ext | Yes | Selectively copies groups of files to disk | XCOPY (diplath)filespec (diplath)filespec/[lpams] XCOPY (diplath)filespec (diplath)filespec/[lpams] XCOPY dipath)filespec (diplath)filespec/[lpams] XCOPY dipath)filespec (diplath)filespec/[lpams] filespect = source files; filespect = destination file(s) /a - copies source files with archive bit set /d data = copies files modified on or after date /b - copies empty subflections (s must be included) /m - same as /a, but turns off archive bit in source after copy /b - prompts at each file /s - copies all subdirectories in path /v - verifies each file as it is written |

^{*}Applies to all versions of MS-DOS or PC-DOS beginning with 4.0. †Applies to all versions of MS-DOS beginning with 5.0. *Does not apply to DOS 5.0.

2.02. EXIT CODES RETURNED BY DOS COMMANDS

| C | Exit Codes |
|----------|--|
| Command | |
| BACKUP | 0 Normal completion |
| l . | 1 No files were found to back up |
| 1 | 2 Some files not backed up due to sharing conflicts |
| | 3 BACKUP terminated by user |
| | 4 BACKUP terminated due to error |
| DISKCOMP | 0 Compared OK; disks are duplicates |
| I . | 1 Did not compare; disks are different |
| 1 | 2 Compare terminated by Control-C |
| | 3 Hard error; comparison not completed |
| | 4 Initialization error; not enough memory, invalid drives or syntax |
| DISKCOPY | 0 Copies OK. |
| DISKCOPT | |
| l . | 1 Nonfatal read/write error |
| | 2 Copy terminated by Control-C |
| | 3 Fatal hard error; unable to read source or format target |
| | 4 Initialization error; not enough memory, invalid drives or syntax |
| FORMAT | 0 Format OK |
| | 3 Format terminated by Control-C |
| | 4 Fatal error |
| ľ | 5 N response to hard disk format prompt |
| GRAFTABL | 0 Command successful; no previous code page loaded |
| GHAFTABL | |
| | 1 Table previously loaded replaced by new one |
| l | 2 File error |
| | 3 Incorrect parameter; no action taken |
| | 4 Incorrect DOS version; no action taken |
| KEYB | 0 Command successful |
| | 1 Invalid syntax |
| | 2 Bad or missing keyboard definition file |
| | 3 Could not create keyboard table in resident memory* |
| | 4 Error with CON device |
| | |
| | 5 Code page requested not prepared |
| | 6 Table for selected code page not found in resident keyboard table* |
| | 7 Incorrect DOS version; no action taken* |
| REPLACE | 0 Command successful |
| | 2 File not found |
| | 3 Path not found |
| | 5 Access Denied |
| | 8 Insufficient memory |
| | 11 Command line error |
| | |
| | 15 Invalid drive* |
| RESTORE | 0 Command successful |
| | 1 No files found to restore |
| | 3 Terminated by user |
| | 4 Terminated due to other error |
| SETVER | 0 Command successful |
| | 11 Invalid command switch |
| | 12 Invalid filename |
| | |
| | 3 Insufficient system memory to carry out command |
| | 4 Invalid version-number format |
| | 5 Entry not found in version table |
| | 6 SETVER.EXE not found |
| | 7 Invalid drive |
| | 8 Too many command line parameters |
| | O Missing command the constructors |
| | 9 Missing command line parameters |
| | 10 Error while reading SETVER.EXE |
| | 11 SETVER.EXE is corrupt |
| | 12 SETVER.EXE does not support version table |
| | |
| | 13 Insufficient space in version table for new entry |
| | 13 Insufficient space in version table for new entry |
| XCOPY | 13 Insufficient space in version table for new entry 14 Error while writing SETVER.EXE |
| XCOPY | 13 Insufficient space in version table for new entry 14 Error while writing SETVER.EXE 0 Command successful |
| XCOPY | 13 Insufficient space in version table for new entry 14 Error while writing SETVER.EXE 0 Command successful 1 No files found to copy |
| XCOPY | 13 - Insufficient space in version table for new entry 14 - Error while writing SETVER.EXE 0 - Command successful 1 - No files found to copy 2 - Terminated by Control-C |
| XCOPY | 13 Insufficient space in version table for new entry 14 Error while writing SETVER.EXE 0 Command successful 1 No files found to copy |

*Not In DOS 5.0.

Version: Applies to all versions of DOS beginning with 4.0.

Note:

Other DOS commands may return values, but are not documented.
A return of 0 is virtually always indicative of success, non-zero indicates an error.

2.03. DOS EXTENDED ERROR MESSAGES

| Number | Message |
|----------|---|
| 1 | Invalid function |
| 2 | File not found |
| 3 | Path not found |
| 4 | Too many open files |
| 5 | Access denied |
| 6 | Invalid handle |
| 7 | Memory control blocks destroyed |
| 8 | Insufficient memory |
| 9 | Invalid memory block address |
| 10 | Invalid environment |
| 11 | Invalid format |
| 12 | Invalid function parameter |
| 13 | Invalid data |
| 15 | Invalid drive specification |
| 16 | Attempt to remove current directory |
| 17 | Not the same device |
| 18 | No more files |
| 19 | Write protect error |
| 20 | Invalid unit |
| 21 | Not ready |
| 22 | Invalid device request |
| 23 | Data error |
| 24 | Invalid device request parameters |
| 25 | Seek error |
| 26 | invalid media type |
| 27 | Sector not found |
| 28 | Printer out of paper error |
| 29 | Write fault error |
| 30 | Read fault error |
| 31 32 | General fallure Sharing violation |
| | |
| 33 34 | Lock violation Invalid disk change |
| 35 | FCB unavailable |
| 36 | System resource exhausted |
| 38 | Out of Input |
| 39 | Insufficient disk space |
| 80 | File exists |
| 82 | Cannot make directory entry |
| 83 | Fail on INT 24 |
| 84 | Too many redirections |
| 85 | Duplicate redirection |
| 86 | Invalid password |
| 87 | Invalid password |
| 88 | Network data fault |
| 90 | |
| 90 | Required system component not installed |

Note: These errors appear when the /MSG parameter is not used for Shell.
These error numbers appear as "Extended Error x" on display.

2.04. DOS PARSE ERROR MESSAGES

| Number | Message |
|--------|--------------------------------------|
| 1 | Too many parameters |
| 2 | Required parameter missing |
| 3 | Invalid switch |
| 4 | Invalid keyword |
| 6 | Parameter value not in allowed range |
| 7 | Parameter value not allowed |
| 8 | Parameter value not allowed |
| 9 | Parameter format not correct |
| 10 | Invalid parameter |
| 11 | Invalid parameter combination |

Applies to DOS 4.0 only. Version:

• These messages appear when the /MSG parameter is not used for Shell. Note:

. These messages appear as "Parse Error x" on display.

2.01. DOS Command Summary 2.02. Exit Codes Returned by DOS Commands 2.03. DOS Extended Error Messages

2.05. EDITING DOS COMMAND LINES

| Key | Function |
|---|--|
| F1 | Supplies next character from the command buffer |
| F2 | Supplies all characters from the command buffer up to the next character you type (e.g., [F2][r] is up to r) |
| F3 | Supplies all remaining characters from the command buffer |
| F4 | Skips all characters from the command buffer up to next character typed (e.g., [F4][r] skips to r) |
| F5 | Erases previous command buffer and replaces it with current command line |
| F6* | Places end-of-file marker (1AH) in the command buffer |
| Esc | Erases current command line |
| > | Supplies next character from the command buffer |
| <t< td=""><td>Deletes character before cursor on current command line</td></t<> | Deletes character before cursor on current command line |
| Backspace† | Deletes character before cursor on current command line |
| Ctrl + H | Removes last character from the current command line |
| Ctrl + J | Inserts a physical end-of-line but does not effect the current command line |
| Ctrl + X§ | Cancels current command line, moves to next line of display |
| Ins | Inserts a character at current spot in the command buffer |
| Del | Deletes the character at the current spot in the command buffer |

| The following k | eys apply only to DOS 5.0 with DOSKEY resident |
|-----------------|--|
| Up Arrow | Displays previous command in command list |
| Down Arrow | Displays next command in command list |
| F7 | Displays list of commands stored by DOSKEY |
| F8 | Cycles through stored commands starting with characters you type (type chars, then F8) |
| F9 | Prompts for the number of a stored command |
| Page Up | Displays oldest command in command list |
| Page Down | Displays newest command in command list |
| Ctrl+T | Separates multiple commands on a single line |
| Home | Moves cursor to beginning of displayed command |
| End | Moves cursor to end of displayed command |
| < | Moves cursor back one character in displayed command |
| > | Moves cursor forward one character in displayed command |
| Ctrl+< | Moves cursor back one word in displayed command |
| Ctrl +> | Moves cursor forward one word in displayed command |
| Backspace | Moves cursor back one character by deleting previous character |
| Del | Deletes current character |
| Ctrl+End | Deletes all characters from cursor to end of line |
| Ctrl+Home | Deletes all characters from cursor to start of line |
| Ins | Toggles between insert and overstrike typing mode |
| Esc | Clears displayed command from screen |

^{*}Applies to all versions of DOS beginning with 4.0. †Applies to all versions of DOS beginning with 5.0. §May not work in all versions.

Note:

DOS keeps the last command typed in a buffer, and it is available even after the execution of a program, e.g., BASICA "myprog" runs a Basic program named "myprog." After the program has finished, the DOS command line buffer still contains BASICA "myprog."

Using IBM DOS 4.0, pages 12 through 13 Microsoft MS-DOS 5.0 User's Guide and Reference, pages 166 through 174

2.06. BATCH FILE COMMANDS

| Command | Function | Syntax | Allowable Settings | Example |
|-----------|--|---|---|--|
| :label | Label (destination of a GOTO statement) | :string | Colon followed by any characters or spaces | :ENDOFBATCHFILE |
| @command* | Does not echo command on display | @command | Any valid DOS or batch command | @ECHO OFF |
| %number | Substitutes command line parameter | %number | 0-9 (0=command name) | DIR %1.%2 |
| %string% | Substitutes environment variable (made with SET) | %string% | Any variable created with SET command | IF %OKAY% == "Y" GOTO YES |
| BREAK | Sets Control-C Interrupt status | BREAK (ON(OFF) | ON, OFF | BREAK ON |
| CALL | Calls another batch file as a subroutine | CALL filename | Filename may include path | CALL DOINST |
| ECHO | Sets echo status or displays string | ECHO [ON OFF] ECHO [string] | ON, OFF, message string | ECHO This is a message. |
| FOR | Performs a command for a set of files | FOR %%var IN (set) DO command | %%var (can be any characters except 0-9) | FOR %%file IN (DOS,WRITE) DO DEL %%file.DAT |
| GOTO | Branches execution to new location in batch file | GOTO label | Any valid label | GOTO ENDOFBATCHFILE |
| IF | Controls execution based upon error level Controls execution based upon existence of file | IF [NOT] ERRORLEVEL # command IF [NOT] EXIST filename command | # = 0-255 Any DOS filename | IF ERRORLEVEL 6 GOTO HEK IF EXIST %1.%2 ERASE %1.%2 |
| | Controls execution based upon string comparison | IF [NOT] string==string command | Any string or %parameter | IF %1=="hogan" GOTO THOM |
| PAUSE | Pauses execution until key pressed | PAUSE [string] | Any message string | PAUSE Press a key to continue. |
| REM | Nonexecutable remark | REM [string] | Any message string | REM Doesn't display if ECHO OFF or @ precedes |
| SHIFT | Shifts command line parameters down one number | SHIFT | NA | SHIFT |

*Command may be any valid DOS command.

Version:

@ is available in DOS 3.3 and above. CALL is available in DOS 3.3 and above.

%string% and SET are not documented in all versions of DOS but appear starting in DOS 2.0. ECHO and REM should be followed by at least one nonspace character in DOS 3.0 and above.

2.07, CONFIG.SYS COMMANDS AND DEFAULT SETTINGS (continued)

| Command | Allowable Settings | Default Settings | Example |
|----------------------|--|----------------------|--------------------------|
| SHELL=[d:][path]file | Allowable commandline is any command | SHELL=COMMAND.COM | SHELL=C:\DOS\COMMAND.COM |
| (commandline) | processor program | | |
| STACKS=n,s | n # of stacks (0-64) | 9,128 for AT & newer | STACKS=12,256 |
| 1 | s size of each stack (0-512) | | · |
| SWITCHES=/k§ | Forces enhanced keybd to act like standard | None | SWITCHES=/k |
| SWITCHAR=char | Any character | \ | SWITCHAR=/ |

^{*}For DOS 2.0-3.2. Beginning with DOS 3.3, if RAM ≥128K, BUFFERS=5; if RAM ≥256K, BUFFERS=10; If RAM ≥512K, BUFFERS=15.

AVAILDEV and SWITCHAR are undocumented and work only in DOS version 2.x. Version:

COUNTRY, FCBS, and LASTDRIVE are available only in DOS 3.0 and later.

STACKS is available only in DOS 3.2 and later. DRIVPARM is generally only used with DOS 3.2.

2.09. PROMPT ANSI CONTROL STRINGS

| String | Function | | | |
|-------------------|---|--|--|--|
| \$e[#;# 1 | Moves cursor to row (first #) and column (second #) position | | | |
| \$e[=# h | Sets display mode according to number (#): 0 = 40x25 monochrome | | | |
| | 1 = 40x25 color | | | |
| | 2 = 80x25 monochrome | | | |
| | 3 = 80x25 color | | | |
| | 4 = 320x200 color graphics | | | |
| | 5 = 320x200 monochrome graphics | | | |
| | 6 = 640×200 monochrome graphics | | | |
| | 7 = wrap at end of line | | | |
| | 14 = 640 x 200 color* | | | |
| | 15 = 640 x 350 mono* | | | |
| | 16 = 640 x 350 color* | | | |
| | 17 = 640 x 480 color* | | | |
| | 18 = 640 x 480 color* | | | |
| | 19 = 320 x 200 color* | | | |
| \$e[=# | Resets display mode according to number (#): 0 = 40x25 monochrome | | | |
| | 1 = 40x25 color | | | |
| | 2 = 80x25 monochrome | | | |
| | 3 = 80x25 color | | | |
| | 4 = 320x200 color graphics | | | |
| | 5 = 320x200 monochrome graphics | | | |
| | 6 = 640x200 monochrome graphics | | | |
| | 7 = do not wrap at end of line | | | |
| \$e[#;;#m | Sets display attributes (see 2.10. PROMPT ANSI Display Attribute Strings) | | | |
| \$e[#;#p | Reassigns first key (first #) to second (second #) or remap key (first #) to ASCII string | | | |
| \$e[#,"string";p | Reassigns key (#) to string (in quotes) | | | |
| \$e[s | Saves current cursor position | | | |
| \$e[u | Restores cursor to saved position | | | |
| \$e[#A | Moves cursor up number of rows Indicated by # (ignored if cursor on top line) | | | |
| \$e[#B | Moves cursor down number of rows indicated by # (ignored if cursor on bottom line) | | | |
| \$e[#C | Moves cursor right number of columns indicated by # (ignored if cursor in last column) | | | |
| \$e[#D | Moves cursor left number of columns indicated by # (ignored if cursor in first column) | | | |
| \$e[F | Moves cursor to the Home position (row 1, column 1) | | | |
| \$e[#;# F | Moves cursor to row (first #) and column (second #) position | | | |
| e[H | Moves cursor to the Home position (row 1, column 1) | | | |
| e[#;# H | Moves cursor to row (first #) and column (second #) position | | | |
| e[2J | Clears display screen | | | |
| e[K | Erases from cursor to end of line, including cursor position | | | |
| e[#;# R | Reports cursor position through standard input | | | |
| Sel 6n | Console driver outputs cursor position report sequence (cannot be used as part of prompt) | | | |

*First documented in MS-DOS 4.0.

Version: Applies to all versions of DOS beginning with version 2.0.

Note: . There should be no spaces in the ANSI control strings. . \$e represents the Escape character (ASCII 27).

2.12. DEBUG COMMAND SUMMARY

| Command Syntax | Function | Example | Example Explanation/Comments |
|----------------------------|--|-------------------|--|
| A | Assemble statements into memory | A | Assemble statements at current pointer |
| | immediately following last assembly entry | | Entry continues until ENTER pressed at start of line |
| A [address] | Assemble statements into memory | A100 | Assemble statements at 100H |
| | beginning at address | | Entry continues until ENTER pressed at start of line |
| C range address | Compare two blocks of memory | C100 L20 200 | Compare 32 (20H) bytes at 100H to |
| | 1 ' | | 32 bytes at 200H |
| D | Dump (display) contents of memory | D | Display memory at current pointer |
| Ì | starting following last position displayed | | 1 , , , , , , , |
| D (address) ¥ | Dump (display) contents of memory | D208 | |
| | starting at address | | |
| D (range) | Dump (display) contents of memory of | D 100 L600 | Display 600H bytes of memory, starting at DS:0100 |
| | range specified | | |
| E address | Enter hex bytes of data beginning | E DS:50 | Enter data beginning at 50H in Data Segment |
| | at address specified | | Entry continues until ENTER pressed; SPACE skips |
| E address [list] | Enter list of bytes beginning | E 100 20 20 | Enter two spaces starting at 100 H |
| | at address specified | | In current segment |
| F range list | Fill memory range with sequence of | F DS:00 L0F "TEH" | Enter five repetitions of TEH at start of Data Segment |
| | bytes in list | | Extra items in list beyond end of range are ignored |
| G | Go (begins execution) at | G | Execute instructions at CS:IP |
| | current instruction (CS:IP) | | |
| G (=address) | Go (begins execution) at address | G =100 | Start execution at 0100H in current CS |
| | | | |
| G [=address [addresslist]] | Go (begins execution) at address | G =100 10A 213 | Same as above, but break if |
| | with breakpoints specified in addresslist | | 10AH or 213H reached |
| H value1 value2 | Hex math performed (add 2 to 1, subtract | H 0F 8 | Add 8 to 0F, subtract 8 from 0F |
| | 2 from 1) on value1 and value2 | | Results displayed on next line |
| I portaddress | Input one byte from portaddress | 12E6 | Get input from port 2E6H |
| | | | Results displayed on next line |
| L | Load file (whose file specification is at | L | Load file whose name and type are at CS:80 |
| | CS:80) beginning with length byte | | File loaded beginning at CS:100 |
| L [address] | Load file (whose file specification is at | L 506 | Load file beginning at 506H in memory |
| | CS:80) beginning at address | | COM/EXE files always loaded at CS:100, however |
| L (address (drive | Load sector2 disk sectors from drive, | L DS:100 2 0 3 | Load first three sectors of drive C |
| sector 1 sector2]]§ | beginning with sector1, into address | | begining at DS:100 |
| M range address | Move memory from range to new address | M 100 L10 500 | Move 16 bytes from 100H to 500H |
| | | | Moves performed w/o loss of memory during transfer |
| N(filespec)† | Name of file to place at CS:81 and In FCBs | N c:debug.com | Prepare debug.com for use |
| | | | by debugger |
| O portaddress byte | Send a byte to specified port | O 2E6 FF | Send FFH to port 2E6H |

(Continued)

2.12. DEBUG COMMAND SUMMARY (continued)

| Command Syntax | Function | Example | Example Explanation/Comments |
|----------------------|--|------------------|--|
| P | Proceed to end of call, loop, interrupt, | P | Execution starts at CS:IP |
| | or repeat string instruction | | P uses same syntax as T(race) |
| P (=address) | Proceed from address to end of call, loop, | P =1044 | Execution starts at CS:1044 |
| • | Interrupt, or repeat instruction | | P uses same syntax as T(race) |
| P (=address) [value] | Proceed from address to end of call, loop, | P =1044 10 | Execution starts at CS:1044 for |
| | Int, or repeat, or for value instructions | | no more than 16 bytes |
| Q | Quit DEBUG | Q | DEBUG is terminated immediately |
| | | | Working memory NOT saved by this command |
| R | Display all registers | R | Display current contents of all registers |
| R registername* | Display contents of registername and | R AX | Display AX contents and wait for new value |
| | allow entry of new value | | Pressing only ENTER leaves contents unchanged |
| S range list | Search the range of memory for the | S 100 L100 "TEH" | Search for pattern "TEH" in 100H bytes starting |
| | contents in list |] | at CS:100H |
| T | Trace a single instruction | T | Trace Instructions from CS:IP, |
| | | | display registers |
| T [=address] | Trace a single instruction at address | T CS:106 | Trace instructions from CS:106H, |
| | - | | display registers |
| T [=address] [value] | Trace value instructions beginning | T 100 10 | Trace 16 instructions from CS:100H |
| | at address | | 0=trace forever (same as G) |
| Ü | Unassemble instructions at CS:IP | Ü | Display disassembly of 20H bytes of instructions |
| | | ľ | at CS:IP |
| U address | Unassemble Instructions at address | U 100 | Display disassembly of 20H bytes of instructions |
| | 1 | | at 100H |
| U range | Unassemble instructions for range bytes | U 100 108 | Display disassembly of instructions |
| - | 1 | | from 100H to 108H |
| Ŵ | Write file (named at CS:81H) to disk | lw | Write file in memory to disk |
| | (80H contains number of bytes) | | BX:CX must contain # of bytes to write |
| W [address] | Write file (named at CS:80H) to disk | W 108 | Write file beginning at 108H in memory to disk |
| | beginning with byte at address | | BX:CX must contain # of bytes to write |
| W (address (drive: | Write data at address to drive starting with | W 108 2 0 3 | Write first three sectors to drive C |
| sector1 sector211 | sector1 for sector2 sectors | 1 | from memory at 108H |
| XA [count]¶ | Number of 16K pages of EM to allocate | XA 8 | Allocate 8 pages of expanded memory |
| XD [handle]¶ | Handle to deallocate | XD 0003 | Deallocate handle 0003 |
| XM [lpage][ppage] | Maps logical page of expanded memory | XM 5 2 0003 | Maps logical page 5 of handle 0003 to physical |
| [handle]¶ | to a physical page of memory | | page 2 |
| KS | Displays expanded memory status | xs | Displays current status |

^{*}Valid registers are: AX, BP, BX, CS, CX, DI, DS, DX, ES, F, IP, PC, SI, SP, and SS. To set flags, use the following two-character mnemonics:

| Flag | Set | Clear |
|---------------------------|----------------|----------------|
| Overflow | ov | NV |
| Direction | DN (Decrement) | UP (Increment) |
| Interrupt | El (Enable) | DI (Disable) |
| Interrupt Sign Zero | NG (Negative) | PL (Plus) |
| Zero | ZR | NZ |
| Auxiliary Carry | AC | NA |
| Parity | PE (Even) | PO (Odd) |
| Саггу | CY | NC |

†MS-DOS 4.0 allows multiple filenames to be used in the N command. ¶Applies to all versions of DOS beginning with 5.0. §DOS 5.0 says last number is the number of sectors. ¥Not in DOS 5.0.

Note:

Lowercase names in command syntax indicate items you replace with values.

2.13. EDLIN COMMAND SUMMARY

| Command Syntax | Function | Example | Example Explanation/Comments |
|--|---|---------------|---|
| A | Append lines from file to memory | A | Append lines from file until 75% of memory is full |
| | | | Applies only if file is too large to fit into memory |
| (#)A | Append # lines from file to memory | 5A | Append 5 lines from file |
| fline1 C | Copy current line to line | 10C | Copy current line to line 10 |
| [line1],[line2],line3 C | Copy range of line 1 to line 2 to area beginning with line 3 | 1,2,3C | Copy lines 1 and 2 to lines 3 and 4 |
| [line1],[line2],line3[,count] C | Copy range of line 1 to line 2 count times to area starting at line 3 | 1,2,3,2C | Copy lines 1 and 2 to lines 3 and 4, 5 and 6 |
| D | Delete current line from memory | D | Delete current line |
| [line1],[line2] D | Delete range of lines between line 1 and line 2 from memory | 1,3D | Delete lines 1 through 3 |
| | Edit current line | | Edit current line |
| line | Edit line number specified | 10 | Edit line number 10 |
| E | End EDLIN and save file | E | End EDLIN and saves changes to file Saves original as file.BAK |
| | Insert line at current line | <u> </u> | Insert new line in front of current line |
| n 11 | Insert line at current line Insert line before line specified | 101 | Insert new line in front of current line Insert new line in front of line 10 |
| [line] I | List 23 lines (11 before current, | 1 | Show current line in context |
| L | current, 11 after current) | ľ | Show current line in context |
| [line1][,line2] L | List lines from line 1 to line 2 | 1,10L | Show lines 1 through 10 |
| [line1].[line2].line3 M | Move range from line 1 to line 2 to area beginning at line 3 | 1,5,10M | Move lines 1 through 5 to line 10 (through 14) |
| [line1,]+n,line3M | Move line1 plus the next n lines to area beginning at line 3 | 5,10,8m | Moves 10 lines beginning at line 5 to line 8 |
| P | List next 23 lines and move current line to last one displayed | P | Page through lines in file |
| [line1][,line2] P | List lines from line 1 to line 2, move current line to line 2 | 1,10P | List first 10 lines and makes line 10 |
| Q | Quit EDLIN without saving changes | ٥ | Leaves EDLIN User is prompted before leaving EDLIN |
| R string1^Zstring2* | Replace string 1 with string 2 from line after current line to last line | Rieh*ZTEH | Replace "teh" with "TEH" from next line to EOF |
| [line1][, line2] R [string1] [*Zstring2]* | Replace string 1 with string 2 in lines from line 1 to line 2 | 1,7Rmy^zour | Replace "my" with "our" in lines 1 through 7 |
| S string* | Search for string from next line through last line in memory | SIBM | Search for "IBM" in lines starting with next one If no string specified, uses last string searched for |
| [line1][,line2]S [string]* | Search for string in range of lines from line 1 to line 2 | 1,10SIBM | Search for "IBM" in lines 1 through 10 If no string specified, uses last string searched for |
| T filespec | Transfer contents of file into memory starting before current line | TAUTOEXEC.BAT | Transfer contents of AUTOXEC.BAT to file |
| (line) T filespec | Transfer contents of file into memory starting before line | 10TCONFIG.SYS | Transfer contents of CONFIG.SYS to area before line 10 |
| w | Write lines from memory to file until 75% of memory is available | W | Write lines to file until 75% of memory is free Needed only if file is too large to fit into memory |
| (#)W | Writes # lines from memory to file | 10W | Write 10 lines to file Needed only if file is too large to fit into memory |

^{*}In some versions of DOS, a ? before the command letter (R or S) will cause the system to prompt for replacement or search string.

Note:

- . EDLIN is considered obsolete in DOS 5.0. Use EDIT instead.
- Lowercase names in command syntax indicate items you replace with values.
 In general, if a line number is omitted from a command, the current line number is used.

IBM DOS 3.3 Technical Reference, pages 8-11 through 8-36 Microsoft MS-DOS 4.0 User's Guide and Reference, pages 173 through 205 Microsoft MS-DOS 5.0 User's Guide and Reference, pages 460 through 481

2.14. LIB OPERATORS SUMMARY

LIB general command form:

| Operator | | Example | Example Explanation |
|----------|--|---------------------|--------------------------------------|
| + | | | Add NEW.OBJ code to YOUR.LIB library |
| - | Delete module from the library | LIB YOUR-MINE | Delete module MINE.OBJ from |
| | | | YOUR.LIB library |
| • | Extract object module from library, place in new file¥ | LIB YOUR.LIB*MY.OBJ | Delete module MY.OBJ from YOUR.LIB |
| | · · · · · · · · · · · · · · · · · · · | | and place it in file MY.OBJ¥ |
| -+ | Delete existing module and replace with new one | LIB YOUR-+MY | Delete module MY.OBJ from YOUR.LIB, |
| 1 | • | | then add new MY.OBJ to library |
| | Extract object module from library and delete it | LIB YOUR.LIB-*MINE | Delete module MINE.OBJ from YOUR.LIB |
| i | | | and save it in file MINE.OBJ |

VIN DOS 4.0, * copies the module from the library to an object file of the same name. The module remains in the library. For example, if you type LIB YOURLIB *MY.OBJ from the LIB command line, module MY.OBJ is copied from YOURLIB library to fill MY.OBJ. DOS 4.0 allows you to provide input by responding to prompts; using a response file you have created, or enting input at the command line.

Version: Not in DOS 5.0.

Note: . Operations are performed in this order: 1) erasures and removals, 2) additions.

· Library files have an assumed type of LIB if not explicitly referenced; object files have an assumed type of OBJ.

2.15 LINK PARAMETERS SUMMARY

LINK general command form:

LINK obilist, runffile, mapfile, liblist[parameters]...:

| LINK objectfiles [,[executablefile][,[mapfile][,[libraryfile]]]][parms] | | | | | | |
|---|---|---|--|--|--|--|
| Parameter* | Function | Comments | | | | |
| /C[PARMAXALLOC]:# † | Sets max # of paragraphs needed by program | Normally 65,535 (all addressable memory) | | | | |
| /D[SALLOCATION]§ | Defines data to be at high end of DGROUP | Default is to load data at the low end of DGROUP | | | | |
| /DO[SEG]† | Links according to DOS segment ordering | CODE, nonDGROUP, DGROUP is DOS ordering | | | | |
| /E[XEPACK]† | Packs executable files | Removes repeated bytes, optimizes load-time | | | | |
| | | relocation table | | | | |
| /HE[LP]† | Shows list of options | | | | | |
| /H[IGH] | Causes run image to be placed as high In | Default is to place the file as low in memory as possible | | | | |
| | memory as possible | | | | | |
| /L[INENUMBERS]¥ | Causes line numbers and addresses in input | | | | | |
| L | modules to be included in list file | | | | | |
| /M[AP] | Lists all public symbols defined in input | The public symbols are listed at end of the list file | | | | |
| | modules and their run file locations | | | | | |
| /NOD[EFAULTLIBRARYSEARCH]† | Ignores library names found in object file | | | | | |
| /NOI[GNORECASE]† | Treats upper- and lowercase letters differently | | | | | |
| /NOG[ROUPASSOCIATION]† | Ignores group associations when assigning | Used only with early versions of FORTRAN or Pascal | | | | |
| | addresses to data and code Items | | | | | |
| /O[VERLAYINTERRUPT]:# † | Sets interrupt # of overlay loading routine | In range of 0 to 255 | | | | |
| /P[AUSE] | Directs LINK to pause before creation of | Message is displayed to change diskettes prior | | | | |
| L | EXE file | to creating EXE file | | | | |
| /SE[GMENTS]:# † | Process no more than # of segments indicated | In range of 1 to 1024 | | | | |
| /ST[ACK]:size' | Overrides stack directive in source | Maximum is 65536; if an odd number, 1 is subtracted | | | | |
| l ' ' | | for even boundary (hex number format: 0x#) | | | | |
| /X£ | Sets number of segments EXE file can contain | Default is 256 segments; limits are 0 to 1024 segments | | | | |
| 3O/ | Links object modules created by version 1 of | | | | | |
| | Pascal or FORTRAN compilers | 1 | | | | |

*Portion of parameter in brackets is optional.

†MS-DOS 4.0 is first to document this option; other versions may include some options.

\$100 3.3 says /D[SALLOCATION] while DOS 4.0 says /D[SALLOCATE] is correct. \$100 \$3.3 says /L is minimum abbreviation, while DOS 4.0 says /L is minimum. \$100 \$3.3 says /S is minimum abbreviation, while DOS 4.0 says /ST is minimum. \$100 \$3.3 says /S is minimum abbreviation, while DOS 4.0 says /ST is minimum. \$100 \$3.3 Technical Reference.

Version: Not In DOS 5.0

Note: Parameters may be added to the four prompts LINK displays when invoked as LINK <Enter>.

2.16. DOSSHELL PROGRAM STARTUP OPTIONS

MS-DOS 4.0 and PC-DOS 4.0 Startup Options

| | Function | Comments |
|--------------|---|---|
| Option | | Comments |
| In | Default prompt | |
| [/T""] | Defines title for prompt panel | Put title between quotes (max 40 chars) |
| [/!""] | Defines instructions for prompt panel | Put Instruction between quotes (max 40 chars) |
| [/P""] | Defines prompt for entry field in prompt panel | Put prompt between quotes (max 20 chars) |
| %number | Substitutes number's run time value (as in batch) | |
| [/D""] | Defines default value for entry field in prompt panel | Put default value between quotes (max 40 chars) |
| [/D"%value"] | Defines default value using run time value | |
| [/R] | Clears the default value in prompt panel entry field | Clears when any key other than edit key pressed |
| [/L"number"] | Sets maximum length in prompt panel entry field | Default and maximum is 127 chars |
| [/M"e"] | Use only existing filenames | |
| [/C"%value"] | Saves run time value entered in preceding task | Otherwise %# will have no value |
| [/F""] | Checks for existence of file | Up to 76 characters |
| /# | Substitutes drive from which Shell started | |
| [%number]* | Defines entry as variable with number as name | Can define up to 10 variables (0-9) |
| <i>(</i> 0 | Substitutes path in which SHELL was started | |

DOS Disk Layouts 2-25

2.20. DATE/TIME FORMATS

In DOS Functions 2AH and 2BH, the date is passed using registers, as follows:

| Element | Register | Format | Allowable Values |
|-------------|----------|--------------|------------------------------------|
| Day of Week | AL | Coded value | 0=Sunday |
| | | | 1=Monday |
| | | | 2=Tuesday |
| | | | 3=Wednesday |
| | | | 4=Thursday |
| | | | 5=Friday |
| | | | 6=Saturday |
| Day | DL | Binary value | 1-31 (corresponds to date) |
| Month | DH | Binary value | 1-12 (corresponds to month number) |
| Year | CX | Binary value | 1980-2099 (must be in this range) |

In DOS Functions 2CH and 2DH, the time is nessed using registers, as follows:

| Hundredths | DL | Binary value | 0-99 (corresponds to hundredths of a second) | | | |
|------------|----|--------------|--|--|--|--|
| Seconds | DH | Binary value | 0-59 (corresponds to seconds) | | | |
| Minutes | CL | Binary value | 0-59 (corresponds to minutes) | | | |
| Hours | CH | Binary value | 0-23 (corresponds to military hours) | | | |

In directory entries and function 57H, the date and time are kept

| as separate 10-bit values | | (least significant b) | te msu, as follows. | | |
|---------------------------|-----------|-----------------------|--------------------------------------|--|--|
| Element | Bits Used | Format | Allowable Values | | |
| Day | 0-4 | 5-bit binary value | 1-31 (corresponds to date) | | |
| Month | 5-8 | 4-bit binary value | 1-12 (corresponds to month number) | | |
| Year | 9-15 | 7-bit binary value | 0-119 (year blased by 1980) | | |
| Seconds | 0-4 | 5-bit binary value | 0-29 (multiply by 2 to get seconds) | | |
| Minutes | 5-10 | 6-bit binary value | 0-59 (corresponds to minutes) | | |
| Hours | 11-15 | 5-bit binary value | 0-23 (corresponds to military hours) | | |

*In function 57H, the 16-bit time value is set/returned in CX, and the 16-bit date value is set/returned in DX.

Note unusual format of seconds in directory entries. Note:

2 21. FAT LAYOUTS

Reserved for DOS

From Directory Entry's Starting Cluster Number

| | Entry # | Example Value | | Use |
|---|---------|---------------|----------------|--------------------------------|
| 1 | 0 | FF8 | Disk ID byte | |
| i | 1 | FFF | Filler | |
| Ī | 2 | 003 | Cluster value: | 000 = unused cluster |
| ľ | 3 | 004 | 1 | 002-FEF = next cluster number |
| | 4 | 005 |] | FF0-FF6 = reserved cluster |
| ı | 5 | FFF | 1 | FF7 = cluster marked bad |
| | 6 | 000 | I | FF8-FFF = last cluster in file |

Note:

In this example FAT, the first entry indicates that it is a FAT for a hard disk (FF8). The first directory entry in the directory for that disk has a starting cluster of 2, thus pointing to cluster number 2 in this table. The second cluster points to the third, the third to the fourth, the fourth to the fifth. The fifth cluster is the last cluster in the file, and thus has a value of FFFH.

Reserved for DOS

From Directory Entry's— Starting Cluster Number

| | Entry # | Example Value | | Use |
|---|---------|---------------|----------------|----------------------------------|
| { | 0 | FFF8 | Disk ID byte | |
| ł | 1 | FFFF | Filler | |
| Ī | 2 | 0003 | Cluster value: | 0000 = unused cluster |
| | 3 | 0004 | 1 | 0002-FFEF = next cluster number |
| Ì | 4 | 0005 | 1 | FFF0-FFF6 = reserved cluster |
| | 5 | FFFF | | FFF7 = cluster marked bad |
| | 6 | 0000 | | FFF8-FFFF = last cluster in file |

Note:

In this example FAT, the first entry indicates that it is a FAT for a hard disk (FFF8H). The first directory entry in the directory for that disk has a starting cluster of 2, thus pointing to cluster number 2 in this table. The second cluster points to the third, the third to the fourth, the fourth to the fifth. The fifth cluster is the last cluster in the file, and thus has a value of FFFFH. Remember, words in the FAT are byte swapped (i.e., least significant byte first).

Warning:

The sources below agree with the information provided above. However, other reputable books, such as the MS-DOS Encyclopedia, indicate that cluster numbers go from 2 to (F)FF6 and bad clusters are marked with (F)FF7H through (F)FFEH, with the last cluster in the file being only (F)FFFH.

| FDH | 40 | 9 | 2 | 5.25-Inch floppy disk |
| | 77 | 26 | 2 | 8-inch floppy disk |
| FCH | 40 | 9 | 1 | 5.25-Inch floppy disk |
| ł | 80 | 9 | 2 | 3.5-Inch microfloppy disk |
| | 80 | 9 | 2 | 5.25-Inch floppy disk |
| FBH | 80 | 8 | 2 | 5.25-inch floppy disk |
| | 80 | 8 | 2 | 3.5-Inch microfloppy disk |
| FAH | 80 | 8 | 1 | 5.25-inch floppy disk |
| | 80 | 8 | 1 | 3.5-inch microfloppy disk |
| FOH | 80 | 18 | 2 | 3.5-inch high-density microfloppy disk |
| F9H | 80 | 9 | 2 | 3.5-Inch microfloppy disk |
| | 80 | 9 | 2 | 5.25-inch floppy disk |
| | 80 | 15 | 2 | 5.25-inch high-density floppy disk |
| F8H | | | | Fixed disk |

Version:

Beginning with DOS 2.x, the usefulness of the disk ID byte in the FAT was reduced, and it is now considered meaningless, since multiple formats may have the same ID. Microsoft recommends that you use the information in the media descriptor table to determine the type of disk being used.

Note:

The disk ID byte is the low-order byte of the first cluster indicator in the FAT (e.g., a first cluster value of FFF8H yields a disk ID byte of F8H).
FOH ID bytes may be used for additional media types.

In older DOS disk partitions, the partition table is followed by: 40(64) | word | Signature | 55AAH (Indicates valid boot record)

*Cylinder and sector are stored in bit-position-coded notation. This applies to the starting cylinder and head and the ending cylinder and head. See below.

The two most significant bits of byte n precede the eight bits of byte n+1 to form the ten-bit cylinder number. The six least significant bits of byte n form the sector number.

†For each extended partition, an additional partition table is appended to the end of the original.

§Not in DOS 5.0

¥DOS 5.0 supplies a partition table for every drive that can be partitioned. The table consists of one or more PARTENTRY structures. The First Partition in the table above represents one PARTENTRY structure.

Note:

 Some manufacturers allow additional partition types in order to divide large capacity hard disks into several drives. . The partition tables begin at an offset of 1BEH in the boot record. The actual boot record is defined by the starting head, cylinder, and sector number, and that sector is loaded to location 7C00H.

| Disk ID byte (in FAT)* | FC | FD | F9 | F9 | FO |
| Number of heads | 1 | 2 | 2 | 2 | |
| Tracks per side | 40 | 40 | 80 | 80 | 80 |
| Sectors per track | 9 | . 9 | 15 | 9 | 18 |
| Bytes per sector | 512 | 512 | 512 | 512 | 512 |
| Sectors per cluster | 1 | 2 | 1 | 2 | 1 |
| Number of reserved sectors | 1 | 1 | 1 | 1 | 1 |
| Number of sectors per FAT | 2 | 2 | 7 | 3 | 9 |
| Number of FATs per disk | 2 | 2 | 2 | 2 | 2 |
| Number of root directory sectors | 4 | 7 | 14 | 7 | 14 |
| Maximum number of root directory entries allowed | 64 | 112 | 224 | 112 | 224 |
| Total number of sectors on disk | 360 | 720 | 2400 | 1440 | 2880 |
| Total number of usable sectors on disk | 351 | 708 | 2371 | 1426 | 2847 |
| Total number of usable clusters on disk | 351 | 354 | 2371 | 713 | 2847 |
| Capacity of disk | 180 KB | 360 KB | 1.2 MB | 720 KB | 1.44ME |
| Format Introduced with DOS version | 2 | 2 | 3 | 3.2 | 3.3 |

*FAT disk ID bytes are unreliable. Use disk parameter block to determine media type.

Note: Total usable sectors and total usable clusters will change if bad sectors are found during formatting.

2.27. EXE FILE HEADER

| Offset | Length | Usual Contents | Description | Comments |
|----------|--------|----------------|--|--|
| 0 (0) | word | 4D5AH | EXE file signature | |
| 2 (2) | word | | Length of file | Modulo 512 |
| 4 (4) | word | | Size of file, including header | In 512-byte pages |
| 6 (6) | word | | Number of relocation table items | |
| 8 (8) | word | | Size of header | In 16-byte paragraphs |
| A (10) | word | | Minimum paragraphs needed above program | In 16-byte paragraphs |
| C (12) | word | | Maximum paragraphs desired above program | In 16-byte paragraphs |
| E (14) | word | | Displacement of stack segment in module | Relative to start of program, in paragraphs |
| 10 (16) | word | | Contents of SP register at entry | |
| 12 (18) | word | | Checksum | Two's complement |
| 14 (20) | word | | Contents of IP register at entry | |
| 16 (22) | word | | Displacement of code module | Relative to start of program (in paragraphs) |
| 18 (24) | word | | Offset to first relocation item in file | Relative to start of file (in bytes) |
| 1A (26) | word | | Overlay number | 0 for resident part of program |
| 1C (28)* | varies | | Variable RESERVED space | |
| varies* | varies | | Relocation table | |
| varies* | varies | | Variable RESERVED space | |
| varies* | varies | | Program and data segments | |
| varies* | varies | | Stack segment | |

*Not In DOS 5.0 EXEHEADER structure

Note: EXE files created for use with Microsoft Windows use a different format (See 6.10. Windows EXE File Format).

See Also: 2.28. COM Program Layout 6.010. Windows EXE File Format

2.28. COM PROGRAM LAYOUT

| ĺ | Offset | Length | Description | Comments |
|---|-----------|-----------|------------------------|---------------------------|
| | | 256 bytes | Program segment prefix | Values filled in by DOS |
| | 100 (256) | varies | Code and data segment | Only one segment allowed |
| | varies | varies | Stack | Usually at top of segment |

The program segment prefix is not usually part of the actual file. It is created and filled in by DOS at program load time. COM files must have code segment ORGed at 100H. Note:

2.27. EXE File Header 2.29. COM Versus EXE File Differences 3.196. PSP Structure

2.29. COM VERSUS EXE FILE DIFFERENCES

| Item | COM Programs | EXE Programs |
|-------------------|---|---|
| Max. program size | 65278° | No limit |
| Segment use | One segment only | Multiple segments allowed |
| Entry point | PSP:0100H | Defined by END Segment |
| CS at entry | PSP | Segment containing module with entry point |
| IP at entry | 0100H | Offset of entry point within its segment |
| DS at entry | PSP | PSP |
| ES at entry | PSP | PSP |
| SS at entry | PSP | Segment with STACK attribute |
| SP at entry | 0FFFEH or top word, whichever is lower | Size of segment defined with STACK attribute |
| Stack at entry | Zero word on stack | initialized or uninitialized |
| Stack size | 65536 - (ProgramSize+256) | Defined in segment with STACK attribute (up to 65536 bytes) |
| Memory allocation | All free memory allocated to program | May be set to allocate portion of memory (offset 0CH in EXE header) |
| Subroutine calls | NEAR CALLs only | NEAR or FAR CALLS allowed |
| Size of file | Exact size of program (might not include PSP) | Size of program plus EXE header (multiple of 512 bytes) |

*65536 - 256-byte PSP - 2-byte STACK

*MS-DOS released only through OEMs, so file sizes vary. †Not available at time of publication

Note:

DOS Version Number

The first total shown is for the entire operating system files only.
 The actual amount of memory used by the operating system is dependent upon the environment size, device drivers that have been loaded, and the settings of the BUFFERS and FILES parameters. All sizes are approximate, since milnor revisions may have affected actual size.

2.31. Operating System Files Summary

2.33. COMMON FILE TYPES (EXTENSIONS)

| File Type | Program | Description |
|-----------|---------------------|--|
| \$\$\$ | DOS | A "pipe" file created by using the redirection flag (i) in a DOS command |
| @@@ | CodeViewDisk | Window-oriented debugger |
| ACT | BITCOM | Communications account data file |
| ACT | Actor | Source code file for Actor programming language |
| AIO | APL | APL file transfer format file |
| AMG | Actor | System image file for Actor programming language |
| APL | APL | APL work space format file |
| APP | SQLWindows | Application file |
| ARF | BASCOM | Automatic response file created by the BM series of compilers; similar to batch files |
| ARF | FORTRAN | Automatic response file created by the BM series of compilers; similar to batch files |
| ARF | COBOL | Automatic response file created by the BM series of compilers; similar to batch files ASCII text file; may be typed to the screen |
| ASC | Many | Assembly language source code file |
| ASM | MASM Paradox | Assembly language source code lile |
| BAK | Many | A backup file; contains a previous version of the information in the file |
| BAS | BASIC | A file containing Basic program code; may not be in ASCII formati |
| BAS | BASICA | A file containing Basic program code; may not be in ASCII formati |
| BAS | MS-QuickBasic | A file containing Basic program code; may not be in ASCII format! |
| BAS | Turbo BASIC | A file containing Basic program code; may not be in ASCII format! |
| BAT | DOS | Batch file; contains commands to be executed by DOS, in order |
| BIN | Many | Binary file; often same as an OBJ file; contains 8-bit information (i.e., not ASCII) |
| BLK | Show Partner | Block file; contains information about a block manipulated by ShowPartner |
| BMP | MS-Windows | Bitmap file; contains data for a Windows bitmap structure |
| C | C compilers | Contains C source code |
| | SuperCalc | Spreadsheet file; contains contents of a spreadsheet |
| CCL | Intalk | Communication command language file |
| CFG | Many | A configuration file; contains information about machine and environment |
| CHK | CHKDSK | Recovered data file; contains data recovered when using the /F option in CHKDSK |
| CLR | Show Partner | Color palette file |
| CLS | Actor | Class library file for Actor programming language |
| | dBASE | Command file; used for file that contains dBASE programs |
| CMD | CP/M-86 | Transient command file (similar to DOS EXE and COM files) |
| СМР | MS-Word | Compare file; contains dictionary of words to compare for spelling |
| | Many | A configuration file; contains information about machine environment |
| COB | COBOL | COBOL program source code |
| | FORTRAN | FORTRAN program compiled code file |
| | MS-Multiplan DOS | Spreadsheet data file; contains contents of a spreadsheet Command (program) file |
| | MS-Windows | Control Panel Applet |
| | MASM | Cross reference file; listing produced by MASM compiler |
| | World Tour Golf | Course data file |
| | Microsoft | Course text file; contains information for on-line tutorials |
| | MS-Windows | Cursor file; contains data for a Windows cursor |
| | Many | Data file; usually contains ASCII or specifically formatted data |
| DB | Paradox | Data file; contains data for a Paradox table |
| DBD | Norton's DEMO | Demonstration data file |
| DBF | dBASE | Data file; contains data for a dBASE database |
| DBS | SQLWindows | Data file; contains data for a SQL Windows database |
| | dBASE | Data file; contains dBASE textual database information |
| DBT | SQLWindows | Temporary data file |
| DCT | SpellStar | Dictionary file; contains spelling dictionary |
| DEF | MS-Windows | Module definition file |
| DEF | Access | |
| DES | Access | |
| DEV | Many | Device driver file; contains code needed by CONFIG.SYS to install a new device |
| DFM | Palantir Filer | Data entry form file |
| DGS | PC-DOS | Diagnostics file |
| DIB | MS-Windows | Device independent bitmap |
| DIC | Many | Dictionary file; contains spelling dictionary |
| DIR | Many SideKick | Data Interchange format file; used to Interchange data between programs |
| DIS | Q&A | Directory file; used with dialing options |
| DLL | MS-Windows | Startup file used by Q&A |
| DOC | Many | Dynamic link library |
| DOC | MS-Word | Document file; may be in ASCII or word processor-specific format |
| DOT | Microsoft | Document file; contains formatted document in non-ASCII form Tutorial file |
| DRV | Many | Device driver file; contains information to drive a specific device |
| DTF | Q&A, PFS | Data file; contains data for a PFS or Q&A database |
| EMU | BITCOM | Terminal emulation file; contains definitions used to emulate a terminal |
| EPS | PageMaker | Encapsulated PostScript file; contains condensed PostScript printer data |
| ERR | various | Error log |
| EXE | DOŞ | Executable program file |
| F# | Paradox | Form file; contains form definition information |
| FLI | Animator | Animation file |
| | | |

2.33. COMMON FILE TYPES (continued)

| File Type FMT FNT FNT FON FOR FRIM 30F 30F 30R 30R 30R | Program | Description |
|--|--|--|
| MI | Program dBASE MS-Windows | Screen format file: contains information about how data is to be displayed on screen Font file: contains description of what a font should look like |
| NI | | Font file: contains description of what a font should look like |
| PAI T | PC Paintbrush MS-Windows FORTRAN | Font file: contains description of what a font should look like |
| MAN | IMS-Windows | GDI loadable font file |
| ČŘ. | FORTRAN | FORTRAN source code file |
| ЯM | dBASE | Report form file; contains information about how a dBASE report should be formatted |
| 31 | various | CompuServe graphic element |
| ÄB | MS-Windows | |
| ARP | IMS-Windows | Group definition |
| 301 | Guide | Guide document |
| 3X1 | Show Partner C compilers | Graphics screen capture file |
| | C compilers | Header file: contains C source code definitions to be merged with other files |
| EX | DEBUG | Hex file: contains ASCII only numbers formatted in Intel HEX format |
| !!N | Access | |
| III ILP XX XX | Many | Help file: contains information to help user understand command or function |
| <u> </u> | MS-Windows | licon file: contains bit image of an icon |
| - | C&A | index file: contains indexing information for a database |
| WG. | MS-Windows | Hi-res scanned image file |
| MP | Pascal | Implementation file for IBM Pascal |
| ήČ | Pascal Durbo BASIC | Include file for Microsoft Pascal |
| VC | Turbo BASIC | Include file for Borland Turbo BASIC Initialization file; contains information about initial state of system |
| <u> </u> | MS-Windowa MS-Word | Impalization file: contains information about initial state of system Printer initialization file |
| 1 | Pascal | Interface file for IBM Pascal |
| 34 | XyWrite | Command file for XyWrite |
| TY | intalk | Settings file |
| AD. | SQLWindows | Journal file |
| OR BD | XvWrite | Keyboard configuration file |
| AV | SuperKey | Layout file: contains keyboard reconfiguration information |
| AY BL | dBASE | Label file |
| 8 | Many | Library file: normally created by a compiler in one of several standard formats |
| NK | MS-Windows/C | TESTAL THE TOTAL STREET STREET STREET STREET STREET STREET STREET |
| 00 | Many | Load file: used by one copy-protection scheme |
| | MASM | Listing file: lists assembled source code |
| AC | ProKey | Keyboard mecro file: contains instructions to execute when certain keys are pressed |
| AČ | SuperKey | Keyboard macro file: contains instructions to execute when certain keys are pressed |
| ΑP | LINK | Map file; a list file created by LINK during the linking proces |
| ЮM | Access | Modern file; contains information about moderns |
| Ē | Many | Usually a READ.ME file containing information about files on disk |
| | dBASE | Memory file |
| | MS-Windows | MIDI file |
| NU | Access | Menu file; contains menu definition |
| ÖÖ | MS-Windows | THE REAL PROPERTY OF THE PROPE |
| ŠĠ | MS-Multiplen | Message file |
| SG | SidelGck | Message file; used with appointment calendar |
| \$ 5 | MS-Windows | Windows Paint file: contains data for a picture drawn with Windows Paint |
| 5x | dBASE | Index file: contains indexing information for a database |
| ET | Paradox | Network configuration file |
| Bu T | LINK | Object code file; contains result of an assembly or compile in a specified format |
| 10 | Microsoft | Backup file |
| | Many | Overlay file: contains part of program to be loaded at a later time |
| vo i | Peradox | Overlay file |
| VL 1 | Meny | Overlay file; contains part of program to be loaded at a later time |
| VR 1 | Marry | Overlay file: contains part of program to be loaded at a later time |
| AL. | PC Paintbrush | Palette file |
| AS | Pascel | Pascal source code file |
| × 1 | PC Paintbrush | Cutout picture file |
| CX 1 | PC Peintbrush PC Peintbrush | Picture file |
| N I | MS-Windows | Printer font metric file |
| SM I | Marry | Usually a program overtay file |
| 1 | Access | |
| c l | Many | Picture file |
| | MS-Windows | Program Information file: used by TopView and Windows to load program into memor |
| X | Macv | File containing one or more pictures |
| | SuperProject | Project file: contains information about a scheduling project |
| 10 | MS-Word | Printer definition file, contains information about how to talk to printer |
| 7 | VisiCalc | Print format file (apreadsheet printed to disk) |
| 10 | VinCalc AASE | Procedure or program file |
| YL VR AA AA AA AA AA AA AA AA AA AA AA AA AA | Hacrard TPM | Project data file |
| NN I | Marw | Print formet file (print to disk) |
| 8 | MS-Word | The second of the second of the second |
| | acel taker | Publication life: contains data for page layout |

2.33. COMMON FILE TYPES (continued)

| File Type | Program | Description |
|-----------|-------------|---|
| PX | Paradox | Primary Index file |
| R# | Paradox | Report format file; contains a report definition |
| RC | MS-Windows | Resource Script file; contains a list of resource definitions used by MS-Windows |
| REF | CREF | Printable cross-reference file (see CRF) |
| RTF | Microsoft | Rich text file |
| sc | Paradox | Script file; contains a PAL script (program) |
| SCN | Microsoft | Screen file; contains screen displays for on-line tutorials |
| SCP | BITCOM | Script file; contains a macro script for communications session |
| SCR | Access | Script file |
| SET | Paradox | Settings file; contains information about settings for a form or table |
| SLK | various | Symbolic Link Format for data transfer (SYLK) |
| SOB | Microsoft | Part of on-line tutorials |
| SOM | Paradox | Sort information file |
| SPL | SQLWindows | SQLTALK Spooler file |
| SPS | Mouse | |
| SQL | SQLWindows | Data file |
| STY | MS-Word | Style sheet; contains style formatting information |
| SYM | MS-Windows | Symbolic debugging definitions |
| SYN | Word Finder | Synonym file; contains information for thesaurus program |
| SYS | Many | Device driver file; contains information to create a device driver under CONFIG.SYS |
| TBK | ToolBook | Book file |
| TIF | Microsoft | Tagged info file format (see 6.011. Tag Image File Format) |
| TMP | Many | Temporary file |
| TPL | Access | |
| TXT | Many | Text file |
| VAL | Paradox | Validity check file |
| VC | VisiCalc | VisiCalc spreadsheet file |
| WAV | MS-Windows | Sound file |
| WCM | MS-Works | Works communications files |
| WDB | MS-Works | Works database file |
| WK1 | Lotus 1-2-3 | 1-2-3 spreadsheet file (version 2) |
| WKS | Lotus 1-2-3 | 1-2-3 spreadsheet file (version 1) |
| WKS | MS-Works | Works spreadsheet file |
| WMF | MS-Windows | Metafile picture (see 6.016, MetaFile Format) |
| WPS | MS-Works | Works word processor file |
| WRI | MS-Windows | Windows Write document file |
| X# | Paradox | Index file |
| XLC | MS-Excel | Chart file |
| XLS | MS-Excel | Spreadsheet file |
| Y# | Paradox | Index file |
| Z# | Paradox | Index file |
| ZIP | PKZIP | Compressed file |

Note:

- A # sign indicates a position held by a digit, 0-9.
 MS-Windows can associate file types with a program. Registration of types is done in the MS-Windows programming SIG on Genie.

Other 2-37

2.34. TYPICAL DOS MEMORY USAGE

| Address | Memory Usage |
|-----------|---|
| 0000:0000 | Interrupt vector table |
| | (see 7.004. I/O Port Usage Summary) |
| 0000:0400 | ROM BIOS parameter area |
| 0000:0500 | DOS parameter area |
| 0000:0700 | IBMBIO |
| 0000:0E30 | IBMDOS |
| 0000:4DB9 | Device drivers |
| 2000-5050 | (includes ANSI.SYS, BUFFERS=, FILES=, etc.) Resident COMMAND.COM |
| 0000:53F0 | |
| 0000:5FD0 | Master environment for COMMAND.COM (see 3.198. Environment Blocks) |
| 0000:6080 | Environment for program |
| 0000.0000 | (if any) |
| 0000:60B0 | Application program |
| 0000.0000 | (if any) |
| | (see 3.196. PSP Structure) |
| | (see 2.29. COM Versus EXE File Differences) |
| 0009:C9E0 | Stack |
| | (expands towards beginning of memory) |
| 0009:CBE0 | Transient COMMAND.COM |
| | (error messages, command table, last command) |
| 000A:0000 | Hardware RESERVED |
| | (video adapters, ROM, ROM expansion) |
| | (see 7.003. PC, AT, and PS/2 Memory Usage Summary) |
| 0010:0000 | |

Version: Memory addresses are for PC-DOS 2.1 only. Other DOS versions will use the same ordering, but the memory addresses may vary. Nonvarying addresses are shown in bold.

2.35. ALLOWABLE CHARACTERS IN FILENAMES

| ASCII Code | Character(s) | Allowed | Illegal |
|------------|---------------------|------------|-------------|
| 00H-1FH | H-1FH Control codes | | |
| 20H | Space | | ~ |
| 21H | Exclamation point | ~ | |
| 22H | Quotation mark | | ~ |
| 23H-29H | Misc. punctuation | ~ | |
| 2AH | Asterisk | | / ** |
| 2BH | Plus sign | | ٧ |
| 2CH | Comma | | ' |
| 2DH | Hyphen | ~ | |
| 2EH | Period | | V** |
| 2FH | Slash | | ١ |
| 30H-39H | Numbers | ~ | |
| 3AH | Colon | | V** |
| 3BH | Semicolon | | ١ |
| 3CH | Less than sign | | \ |
| 3DH | Equals sign | | ~ |
| 3EH | Greater than sign | | ~ |
| 3FH | Question mark | | V** |
| 40H | At sign | ζ. | |
| | Capital letters | ~ | |
| 5BH | Opening bracket | | \ |
| 5CH | Backslash | | V** |
| 5DH | Closing bracket | | ~ |
| | Misc. punctuation | _ | |
| 61H-7AH | | | |
| 7BH | Opening brace | _ | |
| | Vertical line | | ~ |
| 7DH | Closing brace | - | |
| | | | |
| | DEL | | ~ |
| 80H-FFH | IBM extended ASCII | / * | |

^{*}Cannot necessarily be entered directly from keyboard.
**Has special meaning in filenames.

This same table applies to file types, volume, and directory names.
Filenames cannot be AUX, CLOCK\$, COM1, COM2, COM3, COM4, CON, LPT1, LPT2, LPT3, LST, NUL, or PRN, although these names can be used in file extensions.

See Also: 2.36. Filename Separator Characters

2.36. FILENAME SEPARATOR CHARACTERS

| ASCII Codes | Character(s) | Separator | Terminator |
|-------------|-------------------|-----------|------------|
| 00H-1FH | Control codes | Separator | Terminator |
| 09H | Tab | | <u> </u> |
| | | | _ |
| 20H | Space | | _ |
| 22H | Quotation mark | ~ | - |
| 2BH | Plus sign | | - |
| 2CH | Comma | ~ | - |
| 2EH | Period | 7 | <u> </u> |
| 2FH | Forward slash | - | 7 |
| 3AH | Colon | _ | - |
| звн | Semicolon | ~ | 7 |
| 3CH | Less than sign | ~ | 7 |
| 3DH | Equals sign | - | 7 |
| 3EH | Greater than sign | ~ | - |
| 5BH | Opening bracket | - | - |
| 5CH | Backslash | | - |
| 5DH | Closing bracket | ~ | - |
| 7CH | Vertical line | - | ~ |

Note: Filename separators and terminators are used in parsing filenames.

        INT 21H, AH=44H, AL=0CH, Minor Code=4AH - Select Code Page
3.097
3.098
        INT 21H, AH=44H, AL=0CH, Minor Code=4CH - Start Code-Page Prepare
3.099
        INT 21H, AH=44H, AL=0CH, Minor Code=4DH --- End Code-Page Prepare
        INT 21H. AH=44H. AL=0CH, Minor Code=5FH - Set Display Mode
3.100
        INT 21H, AH=44H, AL=0CH, Minor Code=65H - Get Iteration Count
3.101
        INT 21H, AH=44H, AL=0CH, Minor Code=6AH - Query Selected Code Page
3.102
        INT 21H, AH=44H, AL=0CH, Minor Code=6BH - Query Code-Page Prepare List
3.103
        INT 21H, AH=44H, AL=0CH, Minor Code=7FH - Get Display Mode
3.104
        INT 21H, AH=44H, AL=0DH, Minor Code=40H - Set Device Parameters
3.105
        INT 21H, AH=44H, AL=0DH, Minor Code=41H - Write Track on Logical Drive
3.106
        INT 21H, AH=44H, AL=0DH, Minor Code=42H - Format Track on Logical Drive
3.107
        INT 21H, AH=44H, AL=0DH, Minor Code=46H - Set Media ID
3.108
3.109
        INT 21H, AH=44H, AL=0DH, Minor Code=60H --- Get Device Parameters
3 110
        INT 21H, AH=44H, AL=0DH, Minor Code=61H - Read Track on Logical Drive
3.111
        INT 21H, AH=44H, AL=0DH, Minor Code=62H - Verify Track on Logical Drive
3.112
        INT 21H, AH=44H, AL=0DH, Minor Code=66H - Get Media ID
3.113
        INT 21H, AH=44H, AL=0DH, Minor Code=68H — Sense Media Type
3.114
        INT 21H, AH=44H, AL=0EH — Get Logical Drive Map
3.115
        INT 21H, AH=44H, AL=0FH - Set Logical Drive Map
        INT 21H, AH=44H, AL=10H - Query IOCTL Handle
3.116
        INT 21H, AH=44H, AL=11H - Query IOCTL Device
3.117
        INT 21H, AH=45H - Duplicate File Handle
3.118
        INT 21H, AH=46H - Force Duplicate File Handle
3.119
3.120
        INT 21H, AH=47H - Get Current Directory
3.121
        INT 21H, AH=48H - Allocate Memory
        INT 21H, AH=49H - Free Allocated Memory
3.122
3.123
        INT 21H. AH=4AH — Set Memory Block Size
3.124
        INT 21H, AH=4BH, AL=00H - Load and Execute Program
3.125
        INT 21H, AH=4BH, AL=01H - Load Program
3.126
        INT 21H, AH=4BH, AL=03H -- Load Overlay
3.127
        INT 21H, AH=4BH, AL=05H - Set Execution State
        INT 21H, AH=4CH - End Program
3.128
        INT 21H, AH=4DH - Get Child-Program Return Value
3.129
3.130
        INT 21H, AH=4EH - Find First File
        INT 21H, AH=4FH - Find Next File
3.131
3.132
        INT 21H, AH=50H - Set PSP Address
3.133
        INT 21H, AH=51H — Get PSP Address
3.134
        INT 21H, AH=54H - Get Verify State
3.135
        INT 21H, AH=56H -- Rename File
        INT 21H, AH=57H, AL=00H - Get File Date and Time
3.136
3.137
        INT 21H, AH=57H, AL=01H - Set File Date and Time
3.138
        INT 21H, AH=58H, AL=00H — Get Allocation Strategy
        INT 21H, AH=58H, AL=01H - Set Allocation Strategy
3.139
3.140
        INT 21H, AH=58H, AL=02H — Get Upper Memory Link

3,004, INT 21H HANDLE-ORIENTED FUNCTIONS SUMMARY

| INT 21H | Function Name | Use |
|------------|-----------------------------|---|
| Function # | | |
| 3CH | Create file with handle | Creates file for subsequent I/O; erases existing file, if any |
| 3DH | Open file with handle | Readies file for I/O; assigns handle number |
| 3EH | Close file with handle | Closes handle; frees handle number |
| 3FH | Read file or device | Reads from file at current pointer location |
| 40H | Write file or device | Writes to file at current pointer location |
| 41H | Delete file | Deletes file |
| 42H | Move file pointer | Moves location of pointer in file |
| 43H | Get/set file attributes | Changes or retrieves attribute byte for file |
| 45H | Duplicate file handle | Assigns additional handle number to existing handle |
| 46H | Force duplicate file handle | Forces existing handle to refer to file that has a different handle |
| 56H | Rename file | Renames file |
| 57H | Get/set file date/time | Changes or retrieves Last Update time and date associated with file |
| 5AH | Create temporary file | Creates file with unique name for subsequent I/O |
| 5BH | Create new file | Creates file for subsequent I/O only if it does not already exist |
| 67H | Set maximum handle count | Allows you to specify more than 20 handles (default) |
| 68H | Commit file | Insures file is written to disk (flushes buffer) |
| 6CH | Extended Open/Create | Combines Open, Create, and Create New functions |

The first five handle numbers are preassigned by DOS (See 3.188, Predefined Handles) Note:

3,005, INT 21H IOCTL DEVICE-ORIENTED FUNCTIONS SUMMARY

| Function | Subfunction | Minor Code | Function Name | Use | |
|----------|-------------|------------|-------------------------------|---|--|
| 44H | 00H | | Get device data | Gets the device data word used to control device | |
| 44H | 01H | | Set device data | Sets the device data word used to control device | |
| 44H | 02H | | Receive control data from | Receives a string from character-oriented device | |
| | 1 | | character device | | |
| 44H | 03H | | Send control data to | Sends a string to character-oriented device | |
| | | | character device | | |
| 44H | 04H | | Receive control data from | Receives a block of data from block-oriented device | |
| | l . | 1 | block device | | |
| 44H | 05H | | Send control data to | Sends a block of data to block-oriented device | |
| | | | block device | | |
| 44H | 06H | | Check device input status | Checks input device for readiness | |
| 44H | 07H | | Check device output status | Checks output device for readiness | |
| 44H | 08H | | Does device use removable | Reports whether block device contains removable media | |
| | | | media | | |
| 44H | 09H | | Is drive remote | Reports whether block device is local or remote (network) | |
| 44H | 0AH | | Is file or device remote | Reports whether handle referencing device is local or remote | |
| 44H | 0BH | | Set sharing retry count | Sets number of retries and pause between them for a file-sharing device | |
| 44H | 0CH | | Generic IOCTL for character | Sets or gets number of retries for printer devices; prepares code pages | |
| | | | devices | | |
| 44H | 0CH | 45H | Set iteration count | | |
| 44H | 0CH | 4AH | Select code page | | |
| 44H | 0CH | 4CH | Start code-page prepare | | |

3 006, INT 21H DIRECTORY MANAGEMENT FUNCTIONS SUMMARY

| Function | Function Name | Use |
|----------|--------------------------|---|
| 39H | Create Directory | Creates new directory by using specified path |
| 3AH | Remove Directory | Deletes specified directory |
| 3BH | Change Current Directory | Changes current directory to specified path |
| 41H | Delete File | Deletes specified file |
| 47H | Get Current Directory | Returns path of current directory |
| 4EH | Find First File | Searches directory for first matching file or directory |
| 4FH | Find Next File | Searches directory for next matching file or directory |
| 56H | Rename File | Renames or moves file or directory |

3.007, INT 21H DRIVE MANAGEMENT FUNCTIONS SUMMARY

| Function | Subfunction | Function Name | Use | |
|----------|-------------|---------------------------|--|--|
| 0DH | | Reset Drive | Resets drive. Normally used by Ctrl+C | |
| 0EH | | Set Default Drive | Sets specified drive to be default drive | |
| 19H | | Get Default Drive | Returns the number of the default drive | |
| 1AH | | Set Disk Transfer Address | Sets address of buffer used for file I/O and disk searches | |
| 1BH | | Get Default Data Drive | Retrieves information about disk in default drive | |
| 1CH | | Get Drive Data | Retrieves information about disk in specified drive | |
| 1FH | | Get Default DPB | Retrieves drive parameters for default drive | |
| 2FH | | Get Disk Transfer Address | Returns segment:offset of current DTA | |
| 32H | | Get DPB | Retrieves drive parameters for specified drive | |
| 33H | 05H | Get Startup Drive | Returns drive used to load DOS | |
| 36H | | Get Disk Free Space | Returns number of clusters available on drive | |

3.008. INT 21H FILE-SHARING FUNCTIONS SUMMARY

| Function | Subfunction | Function Name | Use |
|----------|-------------|-------------------------|---|
| 44H | OBH | Set Sharing Retry Count | Sets number of times DOS retries a file sharing operation |
| 5CH | 00H | Lock File | Denies access to specified region in file |
| 5CH | 01H | Unlock File | Allow access to specified region in file |

Source: Microsoft MS-DOS 5.0 Programmer's Reference, page 203

3.009. INT 21H CHARACTER I/O FUNCTIONS SUMMARY

| Function | Function Name | T |
|----------|-----------------------------|--|
| 01H | Read Keyboard with Echo | Beads character from CTDIV |
| 02H | Display Character | Reads character from STDIN, writes to STDOUT Displays character on STDOUT |
| 03H | Auxiliary Input | Reads character from AUX. Waits for character |
| 04H | Auxiliary Output | Sends character from AUX. Waits for character Sends character to auxiliary output device |
| 05H | Print Character | Sends character to admirary output device |
| 06H | Direct Console I/O | Reads character from STDIN or writes to STDOUT |
| 07H | Direct Console Input | Reads character from STDIN. Waits for character |
| 08H | Read Keyboard without Echo | Reads character from STDIN. Waits for character |
| 09H | Display String | Sends string to STDOUT |
| OAH | Buffered Keyboard Input | Reads string from STDIN, sends to STDOUT buffer |
| 08H | Check Keyboard Status | Checks availability of character from STDIN |
| OCH_ | Flush Buffer, Read Keyboard | Empties STDIN buffer |

3.010. INT 21H MEMORY MANAGEMENT FUNCTIONS SUMMARY

| Function | Subfunction | Function Name | Use | |
|----------|-------------|-------------------------|--|--|
| 48H | | Allocate Memory | Allocates requested amount of memory and returns address of memory block | |
| 49H | | Free Allocated Memory | Frees memory previously allocated | |
| 4AH | | Set Memory Block Size | Changes size of memory segment or amount of memory allocated | |
| 58H | 00H | Get Allocation Strategy | Returns DOS memory allocation method | |
| 58H | 01H | Set Allocation Strategy | Sets DOS memory allocation method | |
| 58H | 02H | Get Upper-Memory Link | Specifies whether programs can allocate upper memory | |
| 58H | 03H | Set Upper-Memory Link | Links or unlinks upper-memory area | |

3.011, INT 21H PROGRAM MANAGEMENT FUNCTIONS SUMMARY

| Function | Subfunction | Function Name | Use |
|----------|-------------|--------------------------------|--|
| 00H | | Terminate Program | Terminates current program. Returns control to parent program |
| 26H | | Create New PSP | Creates new Program Segment Prefix |
| 31H | | Keep Program | Ends program but leaves it in memory and preserves resources |
| 34H | | Get InDOS Flag Address | Returns address of InDOS flag |
| 4BH | 00H | Load and Execute Program | Loads program, creates new PSP, transfers control to new program |
| 4BH | 01H | Load Program | Loads program and creates new PSP |
| 4BH | 03H | Load Overlay | Loads program and overlay |
| 4BH | 05H | Set Execution State | Prepares new program for execution |
| 4CH | | End Program | Terminates program. Returns control to parent program |
| 4DH | | Get Child-Program Return Value | Retrieves return value specified by last child program |
| 50H | | Set PSP Address | Sets segment address of current PSP |
| 51H | | Get PSP Address | Returns segment address of current PSP |
| 59H | | Get Extended Error | Returns extended error information |
| 5DH | 0AH | Set Extended Error | Sets error information to return |

3.012. INT 21H NATIONAL-LANGUAGE SUPPORT FUNCTIONS SUMMARY

| Function | Subfunction | Function Name | Use | |
|----------|-------------|----------------------------------|--|--|
| 38H | 00H | Get Country Information | Returns country information | |
| 38H | 01H | Set Country Information | Sets country information | |
| 65H | . 01H | Get Extended Country Information | Gets country information for screen and keyboard control | |
| 65H | 02H | Get Uppercase Table | Returns uppercase table for specified code page | |
| 65H | 04H | Get Filename Uppercase Table | Returns address of filename uppercase table | |
| 65H | 05H | Get Filename-Character Table | Returns address of filename character table | |
| 65H | 06H | Get Collate Sequence Table | Returns address of collate sequence table | |
| 65H | 07H | Get Double-Byte Character Set | Returns address of DBCS lead byte range buffer | |
| 65H | 20H | Convert Character | Converts specified character to uppercase | |
| 65H | 21H | Convert String | Converts each character in string to uppercase | |
| 65H | 22H | Convert ASCIIZ String | Converts each character in string to uppercase | |
| 66H | 01H | Get Global Code Page | Identifies code page currently used by all programs | |
| 66H | 02H | Set Global Code Page | Sets code page currently used by all programs | |

3.013. INT 21H SYSTEM MANAGEMENT FUNCTIONS SUMMARY

| INT 21H | Function Name | Use |
|------------|------------------------|--|
| Function # | | <u> </u> |
| 25H | Set interrupt vector | Replace interrupt vector address in low memory |
| 2AH | Get system date | Retrieve current system date |
| 2BH | Set system date | Store new system date |
| 2CH | Get system time | Retrieve current system time |
| 2DH | Set system time | Store new system time |
| 2EH | Set/reset verify flag | Report or set verify flag state |
| 30H | Get DOS version number | Report DOS version being used |
| 31H | Keep process | End program execution but keep resident |
| 33H | Ctrl+C check | Report or change Ctrl+C check status |
| 35H | Get interrupt vector | Report address associated with Interrupt |
| 54H | Get verify state | Report current verify flag setting |

3.014. INT 21H NETWORK FUNCTIONS SUMMARY

| Function | Subfunction | Function Name | Use | | | |
|----------|-------------|---|---|--|--|--|
| 44H | 09H | Is drive remote Reports whether drive letter is local or remote (network) | | | | |
| 44H | 0AH | Is file or device remote | Reports whether device name is local or remote (network) | | | |
| 5EH | 00H | Get machine name | Reports network name of the workstation | | | |
| 5EH | 02H | Set printer setup | Defines string of characters to be sent with each file to printer | | | |
| 5EH | 03H | Get printer setup | Sent with each file to printer | | | |
| 5FH | 02H | Get assign list entry | Reports IDs and names of drives/devices reassigned to network | | | |
| 5FH | 03H | Make network connection | Redirects local drive/device to a network directory/device | | | |
| 5FH | 04H | Delete network connection | Cancels redirection created with function AH=5FH, AL=03H | | | |

Version: Network functions require DOS 3.1 or later

3.015. TYPICAL DOS REGISTER USE

| Register | Standard Usage | # Bits | Comments |
|----------|---|--------|--|
| AX | General purpose accumulator register | 16 | Passes MS-DOS parameters, returns error |
| AH | Function request register | 8 | Contains function number on call (INT 21H) |
| AL | Error return register | 8 | Returns error if carry flag set |
| BX | Data segment base register | 16 | Also returns data (e.g. handle number) |
| CX | Loop counter | 16 | Sometimes used for data passing |
| DX | General purpose data register | 16 | Often used as offset to DS for pointer to data |
| SP | Stack pointer register | 16 | |
| IP | Instruction pointer register | 16 | |
| BP | Stack segment base register | 16 | |
| CS | Code segment of pointer | 16 | |
| DS | Data segment of pointer | 16 | Normally used with DX |
| ES | Extra segment of pointer | 16 | |
| SS | Stack segment of pointer | 16 | Normally used with BX or CX |
| SI | Source index in string operations | 16 | |
| DI | Destination index in string ops | 16 | |
| Flags | Carry flag set=error; carry flag clear=no error | 1 | Used primarily by DOS 2.1 and later |

Upon Return from Function

Function returns no values.

- Functions performs the following:
- Flushes file buffers. - Restores termination handler address from PSP:000AH.
- Restores Ctrl+C exit address from PSP:000EH.
- Restores critical error handler address from PSP:0012H
- Frees memory owned by terminating process.

Applies to all versions of DOS beginning with 2.0. Vereion:

Note: · All open files are closed by this function.

· You must remove all file-sharing locks issued by process before calling this function.

3.174, EXTENDEDFCB STRUCTURE AND EXTHEADER STRUCTURE

| Offset | Length | Name | Contents |
|---------|----------|----------------|---|
| 0 (0)* | byte | extSignature | Always FFH (255) |
| 1 (1)* | 5 bytes | extReserved | |
| 6 (6)* | byte | extAttribute | See 2,19. File Attribute Byte |
| 7 (7) | byte | extDriveID | 0=default, 1=A, 2=B, and so on |
| 8 (8) | 8 bytes | extFileName | ASCII characters, padded with spaces, if necessary |
| 10 (16) | 3 bytes | extExtent | ASCII characters, padded with spaces, if necessary |
| 13 (19) | word | extCurBlockNo | Binary value indicating current block (set to 0 on File Open) |
| 15 (21) | word | extRecSize | Number of bytes per record; default=80 (128) |
| 17 (23) | dbl word | extFileSize | Binary value indicating size of file, in bytes |
| 1B (27) | word | extFileDate | Packed word containing file last update date |
| 1D (29) | word | extFileTime | Packed word containing file last update time |
| 1F (31) | 8 bytes | extReserved | Used internally by DOS |
| 27 (39) | byte | extCurRecNo | Binary value indicating current record |
| 28 (40) | dbl word | extRandomRecNo | Binary value indicating next random block to read/write |

*EXTHEADER structure. Name prefix is eh (ehSignature, ehReserved, ehAttribute).

Version: DOS 5.0 structure. Layout is identical in previous versions of DOS.

Note: . The EXTHEADER structure consists of offsets 0 through 7.

- · A value other than FFH in the first byte of an FCB indicates it is not an Extended FCB (See 3.175. FCB Structure (Opened)).
- In the PSP, an extended FCB starts 7 bytes prior to SCH.

 In the PSP, an extended FCB starts 7 bytes prior to SCH.

 In your program (outside the PSP), your FCB pointer probably points directly to the FFH byte of an extended FCB, or to the drive number byte of a normal FCB. Thus, to insure that you address items in an FCB correctly, you must first know if it is extended or not.

3.175, FCB STRUCTURE (OPENED)

| Offset | Length | Name | Contents |
|---------|----------|----------------|---|
| 0 (0) | byte | fcbDriveID | Drive number; 0=default, 1=A, 2=B, and so on |
| 1 (1) | 8 bytes | fcbFileName | ASCII characters, padded with spaces, if necessary |
| 9 (9) | 3 bytes | fcbExtent | ASCII characters, padded with spaces, if necessary |
| C (12) | word | fcbCurBlockNo | Binary value indicating current block (set to 0 on File Open) |
| E (14) | word | fcbRecSize | Number of bytes per record (default=128) |
| 10 (16) | dbl word | fcbFileSize | Binary value indicating size of file, in bytes |
| 14 (20) | word | fcbFileDate | Packed word containing file create or last update date |
| 16 (22) | word | fcbFileTime | Packed word containing file create or last update time |
| 18 (24) | 8 bytes | fcbReserved | Used internally by DOS |
| 20 (32) | byte | fcbCurRecNo | Binary value indicating current record |
| 21 (33) | dbl word | fcbRandomRecNo | Binary value indicating next random block to read/write |

Version: DOS 5.0 structure. Layout is identical in previous versions of DOS.

Note:

 In the PSP, an extended FCB starts 7 bytes prior to 5CH.
 In your program (outside the PSP), your FCB pointer probably points directly to the FFH byte of an extended FCB, or to the drive number byte of a normal FCB. Thus, to insure that you address items in an FCB correctly, you must first know if it is extended or not (See 3.174, EXTENDEDFCB Structure and EXTHEADER Structure).

Net write fault**

Function not supported by network**††

Required system component not installed**†† **Applies to network installations only

††Not documented in Microsoft MS-DOS 4.0 Programmer's Reference.

Duplicate FCB
Cannot make directory entry
Interrupt 24H failure
Out of structures Already assigned Invalid password*

RESERVED** File exists

+Error Class:

| TETTOT CIASS. | | |
|---------------|-----------------------------------|-----------------------------------|
| Value in BH | Description of Class | Example |
| 1 (1) | Out of a resource | Storage or channels |
| 2 (2) | Temporary situation | Locked region of file |
| 3 (3) | Authorization problem | User doesn't have access rights |
| 4 (4) | Internal error in system software | |
| 5 (5) | Hardware failure | |
| 6 (6) | System software failure | Missing configuration file |
| 7 (7) | Application program failure | |
| 8 (8) | Item not found | File couldn't be found |
| 9 (9) | Invalid format or type | File in wrong format |
| A (10) | Interlocked item | File is interlocked |
| B (11) | Media problem | Wrong disk, bad spot on disk |
| C (12) | Already exists | Declared machine name that exists |
| D(13) | Unknown | |

Suggested Action Value in BL Description of Suggested Action 1 (1) Retry, then prompt user Retry after a brief pause 2(2) 3 (3) If user entered item, prompt for it again 4 (4) Terminate after closing files Terminate immediately; don't close files

No action; error was informational only

Prompt the user to perform an action (e.g., change disk) 5 (5) 6 (6)

| YLocation: | | |
|-------------|----------------------------|----------------------------|
| Value in CH | Probable Location of Error | Example |
| 1(1) | Unknown to DOS | |
| 2(2) | Random access device | Disk drive |
| 3(3) | Network | Network software, hardware |
| 4(4) | Serial device | |
| 5(5) | Memory | RAM |

Version:

DOS 5.0 structure. The layout is identical in previous versions of DOS.
 Error codes apply to all versions of DOS beginning with 2.0.
 Error class, action, and location apply to all versions of DOS beginning with 3.0.

3,197, MEMORY ALLOCATION STRATEGIES

prior to DOS 5 0

| Value | Name | Description |
|-------|-----------|---|
| 0 | First fit | Search beginning at lowest available memory and allocate |
| 1 . | | first block large enough to accommodate request (default) |
| 1 | Best fit | Search all blocks and allocate smallest block |
| | | that accommodates request |
| 2 | Last fit | Search beginning at highest available memory and |
| 1 | | allocate first block large enough to accommodate request |

00550

| DOS 5.0 | | |
|---------|--------------------|--|
| Value | Name | Description |
| 0000h | First_fit_low | Search conventional memory for the available block having the lowest address. This is the default strategy. |
| 0001h | Best_fit_low | Search conventional memory for the available block that most closely matches the requested size. |
| 0002h | Last_fit_low | Search conventional memory for the available block at the highest address. |
| 0080h | First_fit_high | Search the upper-memory area for the available block at the lowest address. If no block is found, the search continues in conventional memory. |
| 0081h | Best_fit_high | Search the upper-memory area for the available block that most closely matches the requested size. If no block is found, the search continues in conventional memory. |
| 0082h | Last_fit_high | Search the upper-memory area for the available block at the highest address. If no block is found, the search continues in conventional memory. |
| 0040h | First_fit_highonly | Search the upper-memory area for the available block at the lowest address. |
| 0041h | Best_fit_highonly | Search the upper-memory area for the available block that most closely matches the requested size. |
| 0042h | Last_fit_highonly | Search the upper-memory area for the available block at the highest address. |

Version: Applies to all versions of DOS beginning with 3.0 (but undocumented in IBM versions).

3.198, ENVIRONMENT BLOCKS

| Offset | Lenath | Name | Contents |
|--------|--------|----------------------|---------------------------------------|
| 0 (0) | varies | Environment string 1 | ASCII string in form: PARAMETER=VALUE |
| varies | byte | String terminator | Must be a 0 |
| varies | varies | Environment string 2 | ASCII string in form: PARAMETER=VALUE |
| varies | byte | String terminator | Must be a 0 |

and so on, until last string:

Note:

| varies | varies | Environment string n | ASCII string in form: PARAMETER=VALUE |
|--------|--------|-------------------------|--|
| varies | byte | String terminator | Must be a 0 |
| varies | byte | String terminator | Must be a 0 |
| varies | word | Count | Number of characters following |
| varies | varies | Initial argument string | ASCIIZ path and file name of current process |

Version: Applies to all versions of DOS beginning with 2.0.

An environment may have no environment strings, in which case the first two bytes are 00,00.
 PARAMETER value is always in uppercase.

3.231, RESERVED DEVICE NAMES AND CHAIN ORDER

| Name | Description | | | | | | |
|-------|--|--|--|--|--|--|--|
| NUL | Null device | | | | | | |
| | Character device drivers, in order encountered in CONFIG.SYS | | | | | | |
| CON | Console keyboard and display | | | | | | |
| AUX | Auxiliary device (COM1:) | | | | | | |
| PRN | Printer device (LPT1:) | | | | | | |
| CLOCK | Timer device (system clock 18.2 ticks/second) | | | | | | |
| | Any other resident block or character devices | | | | | | |
| | Installable block device drivers | | | | | | |

Version: Applies to all versions of DOS beginning with 2.0.

. You may substitute your own device drivers for CON, AUX, PRN, and CLOCK (by redirecting Note: You may substitute your own device drivers for CUN, AUX, PHN, and ULUUM (by reoirect their handles), but you may not redirect NUL
 Devices are "chained" in the order presented in the above table (i.e., NUL is the first entry in the device chain, the CONFIG.SYS drivers are next, and so on)

4.003. EXTENDED BIOS DATA AREA LAYOUT

Location of the Extended BIOS Data Area is determined as follows:

| Location | Function |
|----------|--|
| 40:13 | Kliobytes below 640K limit at which extended BIOS data area begins |

Contents of the extended BIOS Data Area are formatted as follows:

| Offset | Function |
|--------|---|
| 0 | Single byte containing length of extended BIOS data area in K |
| i | Beginning of extended BIOS data area |

Version: PS/1 and PS/2 only

[†]Submodel and revision numbers are returned by BIOS service INT 15H, AH=C0H (Return System Config Parameters).

4.010. INT 9H -- KEYBOARD

Prior to Issuing INT 9H Upon Return from INT 9H

Varies. Interrupt called upon every make or break of every keystroke.

Interrupt returns no values. But certain keys will cause this interrupt to invoke other routines or to fill in information in the BIOS RAM data area.

Version:

Applies to all PC models.

4.024. INT 10H, Palette and Color Values

4.024, INT 10H, PALETTE AND COLOR VALUES*

If AH=0B and BH=0, then BL register contains the border color as follows:

| Value | Color |
|--------|---------------|
| 0 (0) | Black |
| 1 (1) | Blue |
| 2 (2) | Green |
| 3 (3) | Cyan |
| 4 (4) | Red |
| 5 (5) | Magenta |
| 6 (6) | Brown |
| 7 (7) | White |
| 8 (8) | Gray |
| 9 (9) | Light blue |
| A (10) | Light green |
| B (11) | Light cyan |
| C (12) | Light red |
| D (13) | Light magenta |
| E (14) | Yellow |
| F (15) | Bright white |

If AH=0BH and BH=1 then BL register contains a palette number, as follows:

| Value | Palette |
|-------|--------------------|
| 0 | Green/red/brown |
| 1 | Cyan/maganta/white |

*Substantial changes have been made to the definition of the Set Color Palette function with the introduction of EGA.

Upon Return from INT 18H

Interrupt does not return.

Version: On XTs and ATs, INT 18H can be vectored to a "no boot device" routine.

Note: • Interrupt switches control to ROM BASIC.

Not documented in IBM BIOS reference.
 Invoked if no boot code found by INT 19H.

.....**,**

5.002. INT 24H, ERROR CODES

For Error Codes Returned in AH Register:

| | | BIT | NUM | Der | | | | | |
|---------------|---------------|---------------|-----|-----|---|---|---|-------------------|--|
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | Name | Allowable Values |
| | \vdash | $\overline{}$ | r | | | П | 1 | Type of operation | 0=read operation; 1=write operation |
| - | $\overline{}$ | г | - | | ~ | ~ | | Location of error | 00 = DOS Area |
| 1 | | l | ı | 1 | 1 | ı | l | | 01 = FAT |
| 1 | 1 | | l | | ľ | l | l | | 10 = directory |
| i | | | | J | | | 1 | | 11 = data area |
| \vdash | | | | ~ | | | | Fail response | 0 = fall not allowed, 1 = fall allowed |
| _ | | | ~ | | | | | Retry response | 0 = retry not allowed, 1 = retry allowed |
| $\overline{}$ | | ~ | | | | | | Ignore response | 0 = can't be ignored, 1 = can be ignored |
| | ~ | | | | | | | NOT USED | NOT USED |
| ~ | | | | | | | | Device type | 0 = disk drive device†, 1 = other device type* |

For Error Code Returned in Low Byte of Di Register:

| | | | DO: | S Ve | rsior | , |
|------------|--|--------|-----|------|-------|-----|
| Error Code | Error Name | 1.x | 2.x | 3.x | 4.x | 5.x |
| 0 (0) | Write attempt on write-protected media | 7 | 1 | ~ | ~ | ~ |
| 1 (1) | Unknown unit | | ~ | ~ | V | ~ |
| 2 (2) | Drive not ready | ~ | ~ | ~ | ~ | ~ |
| 3 (3) | Unknown command | \neg | ~ | ~ | ~ | ~ |
| 4 (4) | Data error (CRC error) | ~ | ~ | 1 | ~ | ~ |
| 5 (5) | Bad request structure length | | ~ | ~ | ~ | ~ |
| 6 (6) | Seek error | TV | ~ | ~ | 1 | ~ |
| 7 (7) | Unknown media type | | ~ | ~ | ~ | V |
| 8 (8) | Sector not found | 7 | ~ | ~ | ~ | ~ |
| 9 (9) | Printer is out of paper | | ~ | ~ | ~ | ~ |
| A (10) | Write fault | ~ | ~ | ~ | ~ | ~ |
| B (11) | Read fault | | ~ | ~ | ~ | ~ |
| C (12) | General failure | V | ~ | ~ | ~ | ~ |
| D (13) | UNDEFINED | R | R | R | R | R |
| E (14) | UNDEFINED | R | R | R | R | R |
| F (15) | Invalid disk change | \neg | | ~ | | |

†If bit 7=0, then AL contains the failing drive number.

If bit 1 = 0, their AL contains we arming driver himming the contains the state of the fAT is bad, or the error occurred on a character device. To determine the type of error, examine bit 15 of the fifth byte in the device header (attribute bits). If it is 0, the error is a bad memory image of the FAT. Otherwise, bits 0-3 will tell you what character device failed, as follows:

| | Bit | Num | ber | |
|---|--------|-----|-----|------------------------------|
| 3 | 2 | 1 | | Character Device that Failed |
| | \Box | | | Current standard input |
| | | ~ | | Current standard output |
| | 7 | | | Current NULL device |
| ~ | | | | Current clock device |

Legend: √=supported R=reserved

Note: These are the same error codes returned by a device driver in its request header.

5.071, INT 33H, AX=04H -- SET MOUSE CURSOR POSITION

Prior to lesuing INT 33H

Upon Return from INT 33H

Interrupt returns no values.

Note:

- Position may be rounded to nearest values if screen is not in high resolution mode.
- Position must be within range for current video mode.
 Cursor appears unless one of following is true:
- Function 1 hasn't yet displayed the cursor. - Function 2 hid the cursor.
- Function 0 or 21H (33) hid the cursor during reset.
- Cursor would appear in conditional-off region established by Function 10H (16).

| ## FH, 2 (79,2) Get size of partial page-map Info Added with 4, 50H, 1 (80,0) Map multiple pages by number Added with 4, 50H, 1 (80,1) Map multiple pages by address Added with 4, 52H, 0 (82,0) Get handle attribute Added with 4, 52H, 1 (82,1) Set handle attribute Added with 4, 52H, 1 (82,1) Set handle attribute Added with 4, 53H, 0 (83,0) Get handle attribute Added with 4, 53H, 0 (83,0) Get handle name Added with 4, 53H, 0 (83,0) Get handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get total handles Added with 4, 64H, 0 (85,0) Map pages and call S7H, 0 (85,01) Map pages and call S7H, 0 (87,0) Move memory region Added with 4, Added with 4, 56H, 0 (88,0) Get addresses of mappable pages Added with 4, 64H, 1 (88,1) Get number of ram pagale pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) Get number of raw pages Added with 4, 64H, 1 (88,1) | | 4FH, 0 (79,0) | Save partial page map | Added with 4.0† |
| 4FH, 2 (79,2) Get size of partial page-map Info Added with 4, 50H, 1 (80,1) Map multiple pages by address Added with 4, 50H, 1 (80,1) Map multiple pages by address Added with 4, 52H, 0 (82,0) Get handle attribute Added with 4, 52H, 1 (82,1) Set handle attribute Added with 4, 52H, 2 (82,2) Get shandle attribute Added with 4, 52H, 2 (82,2) Get attribute capability Added with 4, 52H, 2 (82,2) Get attribute capability Added with 4, 54H, 0 (83,0) Get handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get total handle name Added with 4, 54H, 0 (84,0) Get total handles Added with 4, 54H, 0 (84,0) Get total handles Added with 4, 54H, 0 (84,0) Map pages and call S7H, 0 (87,0) Move memory region Added with 4, 34H, 34H, 34H, 34H, 34H, 34H, 34H, 3 | 1 | | Restore partial page map | Added with 4.0† |
| SOH, 1 (80,1) Map multiple pages by address Added with 4, 52H, 0 (82,0) Get handle attribute Added with 4, 52H, 1 (82,1) Set handle attribute Added with 4, 52H, 2 (82,2) Get attribute capability Added with 4, 52H, 2 (82,2) Get attribute capability Added with 4, 52H, 0 (83,0) Get handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get total handles Added with 4, 54H, 0 (84,0) Map pages and call Get total handles Added with 4, 55H, 0 (87,0) Map pages and call S7H, 0 (87,0) Move memory region Added with 4, 55H, 0 (87,0) Move memory region Added with 4, 55H, 0 (87,0) Get addresses of mappable pages Added with 4, 55H, 1 (88,1) Get number of raw pages Added with 4, 55H, 1 (89,1) Get number of raw pages Added with 4, 55H, 1 (89,1) Get number of raw pages Added with 4, 55H, 1 (92,1) Get alternate map registers Added with 4, 4dded with 4, 64H, 1 (92,1) SBH, 1 (92,2) Get size of alt map register set Added with 4, 4dded with 4, 1 (92,1) SBH, 1 (92,2) Get size of alt map register set Added with 4, 4dded with 4, 4dded with 4, 64H, 1 (92,1) SBH, 1 (92,2) Get size of alt map register set Added with 4, 4dded with 4, 4dded with 4, 64H, 1 (92,4) Selbicotate handle and raw pages Added with 4, 4dded with 4, 64H, 1 (92,4) Selbicotate halfernate map register set Added with 4, 4dded with 4, 64H, 1 (92,4) Selbicotate handle and raw pages Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, | 1 | | | Added with 4.0† |
| SOH, 1 (80,1) Map multiple pages by address Added with 4, 52H, 0 (82,0) Get handle attribute Added with 4, 52H, 1 (82,1) Set handle attribute Added with 4, 52H, 2 (82,2) Get attribute capability Added with 4, 52H, 2 (82,2) Get attribute capability Added with 4, 52H, 0 (83,0) Get handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 0 (84,0) Get total handles Added with 4, 54H, 0 (84,0) Map pages and call Get total handles Added with 4, 55H, 0 (87,0) Map pages and call S7H, 0 (87,0) Move memory region Added with 4, 55H, 0 (87,0) Move memory region Added with 4, 55H, 0 (87,0) Get addresses of mappable pages Added with 4, 55H, 1 (88,1) Get number of raw pages Added with 4, 55H, 1 (89,1) Get number of raw pages Added with 4, 55H, 1 (89,1) Get number of raw pages Added with 4, 55H, 1 (92,1) Get alternate map registers Added with 4, 4dded with 4, 64H, 1 (92,1) SBH, 1 (92,2) Get size of alt map register set Added with 4, 4dded with 4, 1 (92,1) SBH, 1 (92,2) Get size of alt map register set Added with 4, 4dded with 4, 4dded with 4, 64H, 1 (92,1) SBH, 1 (92,2) Get size of alt map register set Added with 4, 4dded with 4, 4dded with 4, 64H, 1 (92,4) Selbicotate handle and raw pages Added with 4, 4dded with 4, 64H, 1 (92,4) Selbicotate halfernate map register set Added with 4, 4dded with 4, 64H, 1 (92,4) Selbicotate handle and raw pages Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, 64H, 1 (94,2) Get size of alt map register set Added with 4, | 1 | 50H, 0 (80,0) | Map multiple pages by number | Added with 4.0† |
| S2H, 0 (82,0) Get handle attribute | | 50H, 1 (80,1) | Map multiple pages by address | Added with 4.0† |
| S2H, 1 (82.1) Set handle attribute Added with 4, | | 51H (81) | | Added with 4.0† |
| S2H, 2 (82,2) Get attribute capability | | | | Added with 4.0† |
| 53H, 0 (83,0) Get handle name Added with 4, 54H, 0 (84,0) Get all handle name Added with 4, 54H, 1 (84,1) Search for handle name Added with 4, 54H, 1 (84,1) Search for handle name Added with 4, 54H, 2 (84,2) Get total handles Added with 4, 55H, 07 (85, 07) Map pages and call 55H, 07 (86, 07) Map pages and call 57H, 0 (80, 0) Get stack space for map page and call 57H, 0 (87,0) Exchange memory region Added with 4, 56H, 2 (86,2) Get stack space for map page and call 57H, 1 (87,1) Exchange memory region Added with 4, 56H, 0 (88,0) Get addresses of mappable pages Added with 4, 56H, 1 (88,1) Get number of mappable pages Added with 4, 56H, 1 (89,1) Get number of raw pages Added with 4, 56H, 1 (89,1) Get number of raw pages Added with 4, 56H, 1 (89,1) Get number of raw pages Added with 4, 56H, 1 (89,1) Get alternate map registers Added with 4, 56H, 1 (89,1) Get alternate map registers Added with 4, 56H, 1 (89,1) Get alternate map register set Added with 4, 56H, 1 (89,1) Get alternate map register set Added with 4, 56H, 1 (89,1) Get alternate map register set Added with 4, 56H, 1 (89,1) Get physical window array Get physical window arr | | 52H, 1 (82,1) | Set handle attribute | Added with 4.0† |
| 53H. 1 (83.1) Set handle name Added with 4 | | 52H, 2 (82,2) | | Added with 4.0† |
| 54H. 0 (84.0) Get all handle names | | 53H, 0 (83,0) | | Added with 4.0† |
| 54H, 1 (84, 1) Search for handle name | | | | Added with 4.0† |
| 54H, 2 (84.2) Get total handles | | | | |
| S5H, 0/1 (85, 0/1) Map pages and jump Added with 4, | 1 | | | |
| S6H, 0/1 (86, 01) Map pages and call S6H, 2 (86,2) Get stack space for map page and call 57H, 0 (87.0) Move memory region Added with 4. Added with 4. S6H, 0 (87H, 0 (87.0) Move memory region Added with 4. Added with 4. Added with 4. Added with 4. S6H, 0 (88.0) Get addresses of mappable pages Added with 4. Added w | 1 | | | |
| 56H, 2 (86,2) Get stack space for map page and call 57H, 0 (87,0) Move memory regions 58H, 1 (88,1) Exchange memory regions 58H, 0 (88,0) Get addresses of mappable pages 58H, 1 (88,1) Get number of mappable pages 58H, 1 (88,1) Get number of mappable pages 58H, 0 (99,0) Get hardware configuration 59H, 0 (99,0) Allocate handle and standard pages 5AH, 0 (191,0) Allocate handle and standard pages 5AH, 0 (192,0) Get alternate map registers 5BH, 1 (92,1) Set alternate map registers 5BH, 1 (92,1) Get alternate map register save area 5BH, 3 (92,3) Allocate alternate map register set 5BH, 5 (92,5) Allocate alternate map register set 5BH, 5 (92,5) Allocate DMA register set 5BH, 6 (92,6) Enable DMA on alt map register set 5BH, 8 (92,8) Deallocate DMA register set 5BH, 6 (92,6) Enable DMA on alt map register set 5BH, 1 (94,2) Beallocate DMA register set 5BH, 1 (94,2) Beallocate DMA register set 5BH, 1 (94,4) Bealbe EMM OS functions 5DH, 0 (94,0) Enable EMM OS functions 5DH, 0 (94,0) Get system physical window array 69H Get system physical window array 69H Map page into window 6AH,1 Set system map 6AH,2 Swap system map 6AH,3 Get map size 6AH,5 Set alternate mapping 6EMS only§ 6EMS o | ŀ | | | |
| 57H, 0 (87.0) Move memory region | | | | |
| 57H, 1 (87.1) Exchange memory regions Added with 4. | 1 | | | |
| 58H, 0 (88,0) Get addresses of mappable pages Added with 4, 59H, 0 (89,0) Get humber of mappable pages Added with 4, 59H, 0 (89,0) Get humber of mappable pages Added with 4, 59H, 0 (89,0) Get humber of raw pages Added with 4, 59H, 0 (90,0) Allocate handle and standard pages Added with 4, 59H, 0 (92,0) Allocate handle and raw pages Added with 4, 59H, 1 (92,1) Allocate handle and raw pages Added with 4, 59H, 2 (92,2) Get alternate map registers Added with 4, 59H, 2 (92,2) Get size of alt map register set Added with 4, 59H, 3 (92,3) Allocate laternate map register set Added with 4, 59H, 3 (92,3) Allocate alternate map register set Added with 4, 59H, 2 (92,6) Allocate DMA register set Added with 4, 59H, 6 (92,6) Enable DMA on alt map register set Added with 4, 59H, 6 (94,0) Shipt, 1 (94,1) Disable DMA on alt map register set Added with 4, 59H, 6 (94,0) Get system map EMS only 6, 6 (94,0) Get system map EMS only 6, 6 (94,0) Get system map EMS only 6, 6 (94,0) Get system map EMS only 6, 6 (94,1) Get standard mapping EEMS only 6, 6 (94,1) Get standard mapping | | | | |
| 58H, 1 (88,1) Get number of mappable pages Added with 4, 59H, 0 (89,0) Get hardware configuration Added with 4, 59H, 1 (89,1) Get number of raw pages SAH, 0 (90,0) Allocate handle and standard pages Added with 4, 59H, 1 (92,1) Set alternate map registers Added with 4, 59H, 1 (92,1) Set alternate map register save area SBH, 2 (92,2) Get size of alt map register save area SBH, 2 (92,2) Get size of alt map register save area SBH, 2 (92,2) Get size of alt map register save area SBH, 2 (92,2) Get size of alt map register save area SBH, 2 (92,2) Get size of alt map register save area SBH, 2 (92,2) Get size of alt map register save area SBH, 5 (92,5) Geallocate alternate map register save Added with 4, 2 (92,4) Geallocate DMA register save Added with 4, 3 (94,2) Geallocate DMA register save Added with 4, | 1 | | | |
| 59H, 0 (89.0) Get hardware configuration Added with 4. | 1 | | | |
| S9H, 1 (89.1) Get number of raw pages | | 50H, I (00,I) | | |
| SAH. 0 (90.0) Allocate handle and standard pages Added with 4, 95 | | | | |

5.185. INT 67H, EXPANDED MEMORY MANAGER ERROR CODES

| Code | Description | Comments |
|------|--|---|
| 00H | Normal return code | No error occurred |
| 80H | Software error | Might Indicate corrupted memory image of driver |
| 81H | Hardware error | |
| 82H | EMM is busy | |
| 83H | Unallocated or invalid handle | |
| 84H | Undefined function code | |
| 85H | Out of handles | |
| 86H | Error in save or restore mapping context | |
| 87H | Page count error | Requested > total physical pages; no pages allocated |
| 88H | Page count error | Requested > total available pages; no pages allocated |
| 89H | Requested zero pages | |
| 8AH | No logical page for this handle | |
| 8BH | Physical page outside valid range | |
| 8CH | Context stack out of memory | |
| 8DH | Handle already has context stack | |
| 8EH | No context stack for that handle | |
| 8FH | Undefined subfunction code | |
| 90H | Subfunction parameter not defined | |
| 91H | Feature not supported | |
| 92H | Source and destination regions overlap | Requested move performed, but part of source region overwritten |
| 93H | Length longer than allocated length | |
| 94H | Conventional and expanded memory regions overlap | |
| 95H | Offset outside of logical page | |
| 96H | Region length greater than 1MB | |
| 97H | Source and destination regions overlap | Exchange was not performed |
| 98H | Memory source and destination types undefined | |
| 99H | UNUSED | |
| 9AH | Alt register set specified does not exist | Alt map or DMA register sets are implicitly supported, however |
| 9BH | Alt register set currently allocated | |
| 9CH | Alt register set specified was not 0 | Alt map or DMA register sets are not supported |
| 9DH | Alt register set specified was not defined | |
| 9EH | Dedicated DMA channels not supported | |
| 9FH | Specified DMA channel not supported | DMA channels implicitly supported, however |
| A0H | Handle for name not found | |
| A1H | Handle with the same name already exists | |
| A2H | Memory address wraps | Sum of source or destination base address & length exceeds 1MB |
| A3H | Invalid pointer | Or contents of source array have been corrupted |
| A4H | Access to function denied by OS | |

5.204. XMS ERROR CODES

| Code | Description |
|------|------------------------------------|
| 80H | Function not implemented |
| 81H | VDISK device driver was detected |
| 82H | A20 error |
| 8EH | General driver error |
| 8FH | Unrecoverable driver error |
| 90H | HMA does not exist |
| 91H | HMA is already in use |
| 92H | DX is less than /HMAMIN=parameter |
| 93H | HMA is not allocated |
| 94H_ | A20 line is still enabled |
| A0H | All extended memory is allocated |
| A1H | EMM handles are exhausted |
| A2H | Handle is invalid |
| A3H | Source handle is invalid |
| A4H | Source offset is invalid |
| A5H | Destination handle is invalid |
| A6H | Destination offset is invalid |
| A7H | Length is invalid |
| A8H | Overlap in move request is invalid |
| A9H | Parity error detected |
| AAH | Block not locked |
| ABH | Block locked |
| ACH | Lock count overflowed |
| ADH | Lock failed |
| BOH | Smaller UMB is available |
| B1H | No UMBs are available |
| B2H | UMB segment number is invalid |

5.222. TASK SWITCHER API PATCH

Every program that uses Build Notification Chain (INT 2FH, Function 4801H) or Hook Notification Chain (Service Function 0004H) must check for and install this patch each time the Task Switcher calls Query Suspend (Notification Function 0001H).

Without the patch, the Task Switcher behaves erratically and may lose data. The problem occurs because the Task Switcher inadvertently clears the CX register, which may affect subsequent DOS system functions.

Programs can check for and install the patch by executing the Patch Swapper routine given below. On entry, the client program must make sure the ES:DI registers point to the Task Switcher's service-function address. This is the same address provided by the Task Switcher when it calls Cuery Suspend.

6.001. RESERVED SYSTEM KEYS AND RECOMMENDED KEYBOARD ACTIONS

| Key Name | Windows Action |
|------------------------|--|
| Alt+letter | Selects menu from active menu bar |
| Alt+Shift+Tab | Selects active window from bottom up |
| Alt+Spacebar | Selects System menu of active window |
| Alt+Tab | Selects active window from top down |
| Alt+Backspace§ | Undo reverses last user action |
| Alt+Escape† | Selects next application |
| Alt+F10† | Enlarges window |
| Alt+F4† | Closes window |
| Alt+F5† | Restores window |
| Alt+F6§ | Changes active window |
| Alt+F7† | Moves window |
| Alt+F8† | Sizes window |
| Alt+F9† | Shrinks window |
| Backspace | Deletes selection or deletes character to left of cursor |
| Ctrl+F6§ | Changes active secondary window |
| Ctrl+End§ | Moves cursor to bottom rightmost choice |
| Ctrl+Escape† | RESERVED |
| Ctrl+Home§ | Moves cursor to top leftmost position in current field |
| Ctrl+Ins§ | Copy duplicates selected object/text and copies it to clipboard |
| Ctrl+Left arrow§ | Moves cursor to beginning of word to left of cursor |
| Ctrl+PgDn§ | Scrolls to information to right of currently visible window area |
| Ctrl+PgUp§ | Scrolls to Information to left of currently visible window area |
| Ctrl+Right arrow§ | Moves cursor to beginning of word to right of cursor |
| Ctrl+Shift+Left arrow | Extends selection to beginning of word |
| Ctrl+Shift+Right arrow | |
| Del§ | Deletes existing selection or character to left of cursor |
| Down arrow* | Selects command or choice below current one |
| End | Moves cursor to rightmost choice |
| Enter | Invokes selected command or action |
| Escape | Cancels menu or dialog box |
| F1 | Displays information about Item or dialog box |
| F5 | Updates contents of windows |
| F10† or Alt§ | Selects system menu or action bar of active window |
| F6§ | Moves cursor in clockwise direction between split windows |
| Home§ | Moves cursor to leftmost choice |
| Ins§ | Toggles between insert and replace mode in field entry |
| Left arrow* | Selects menu or choice to left of current one |
| PaDn§ | Scrolls to information below currently visible window area |
| PqUp§ | Scrolls to information above currently visible window area |
| Right arrow* | Selects menu or choice to right of current one |
| Shift+Down arrow§ | Extends selection to line below |
| Shift+End | Extends selection to end of current line |
| Shift+Escape† | Selects system menu of active window |
| Shift+Home | Extends selection to beginning of current line |
| Shift+Left arrow§ | Extends selection one character to left |
| Shift+Right arrow§ | Extends selection one character to right |
| Shift+Up arrow§ | Extends selection to line above |
| Shift+Tab | Selects active control or field from bottom up |
| Shift+Del§ | Cut removes selected object/text and copies it to clipboard |
| Shift+arrow | Extends selection in that direction |
| Shift+Ins§ | Paste copies clipboard contents to selected location |
| Spacebar | Invokes default action (default push button) or toggles choice§ |
| Tab | Selects active control or field from top down |
| Up arrow* | Selects command or choice above current one |
| ор апон | Delects command or choice above current one |

†Applies to versions of Windows beginning with 2.0 only. §First defined by IBM's SAA guidelines. *Any direction key of this type should not be redefined.

Note: On international keyboards, only the left Alt key should be used as an accelerator.

6.013. WINDOWS PAINT FILE FORMAT

| Offset | Length | Usual Contents | Description |
|---------|--------|----------------|--|
| 0 (0) | Word | 6144H | Key#1 (version of paint program used to create file) |
| 2 (2) | Word | 4D6EH | Key#2 (version of paint program used to create file) |
| 4 (4) | Word | | Width of bitmap (in pixels) |
| 6 (6) | Word | | Height of bitmap (in pixels) |
| 8 (8) | Word | | X aspect ratio of bitmap |
| A (10) | Word | | Y aspect ratio of bitmap |
| C (12) | Word | | X aspect ratio of printer at creation time |
| E (14) | Word | | Y aspect ratio of printer at creation time |
| 10 (16) | Word | | Width of printer in pixels |
| 12 (18) | Word | | Height of printer in pixels |
| 14 (20) | Word | | Used for checksum calculations |
| 16 (22) | Word | | Used for checksum calculations |
| 18 (24) | Word | | Checksum of header |
| 1A (26) | Word | | RESERVED |
| 1C (28) | Word | | RESERVED |
| 1E (30) | Word | | RESERVED |
| 20 (32) | Varies | | Bitmap |

Paint files in versions of Windows beginning with 2.03 use a different format. Version:

· A paint file (version 1.01) consists of a 32-byte header, as described above, Note: A paint liet (version 1.01) consists of a 32-byte header, as described above, followed by a bitmap organized as scan lines. The total size of the bitmap will be = WidthOlBitmap x HelphOlBitmap 8
 The third through tenth fields in the header are determined by calling GetDeviceCaps().

6.014. FONT FILE FORMAT (continued)

| Fleid | Size | Description | Allowable Values |
|---------------|-----------|--|--------------------------------------|
| dfFace | Dbl word | Offset in file to face name string | |
| dfBitsPointer | Dbl word | Absolute address of bitmap | (Set by GDI at load time) |
| dfBltsOffset | Dbl word | Offset in file to beginning of bitmap | |
| dfCharOffset | Word each | Offset in bitmap rows to each char in set | For variable-spaced raster fonts |
| | 0 bytes | Not used | For fixed-spaced raster fonts |
| i | Word each | | For fixed-spaced vector fonts |
| ļ | Word | Offset in bitmap to char strokes for each char | For variable-spaced vector fonts |
| l . | Word | Pixel width of the character | 1 |
| (facename) | String | Name of typeface | ASCIIZ string |
| (devicename) | String | Name of device font was designed for | ASCIIZ string |
| (bltmap) | Bytes | Bitmap containing font data | Each row must start on word boundary |

Version:

Applies to all versions of Windows beginning with 2.0.

6.015. CLIPBOARD FORMATS AND CLIPBOARD FILE FORMAT

Clipboard Format Names

| Format Name | Description |
|--------------------|--|
| CF_BITMAP | Handle to bitmap (HBITMAP) |
| CF_DIB* | Memory block containing BITMAPINFO data structure and bitmap |
| CF_DIF | Software Arts Data Interchange Format |
| CF_DSPBITMAP | Bitmap display associated with a private format |
| CF_DSPMETAFILEPICT | Metafile picture display associated with a private format |
| CF_DSPTEXT | Text display associated with a private format |
| CF_METAFILEPICT | Metafile picture structure (See 6.69. METAFILEPICT Structure Format) |
| CF_OEMTEXT* | Text containing characters in OEM character set |
| CF_OWNERDISPLAY | Owner display format (clipboard owner must display and update clipboard) |
| CF_PALETTE* | Handle to color palette |
| CF_PRIVATEFIRST | Private format begins with this value |
| CF_PRIVATELAST | Private format ends with this value |
| CF_SYLK | Microsoft SYLK data interchange format |
| CF_TEXT | Text ends with CR-LF-NULL |
| CF_TIFF* | Tag Image File Format (see 6.011. Tag Image File Format) |

| _(| Clipboard F | ormat | | |
|----|-------------|--------|----------------|---------------------------------------|
| Е | Offset | Length | Name | Description |
| Ε | 0 (0) | Word | FileIdentifier | Must be set to CLP_ID |
| Ε | 2 (2) | Word | FormatCount | Number of clipboard formats contained |
| Ε | 4 (4) | Word | ClipboardArray | |

| Length | Name | Description |
|----------|---------|--|
| WORD | | One of the above clipboard formats |
| DWORD | LenData | Length of clipboard data, in bytes |
| DWORD | | Offset, in bytes, to data block |
| 79-bytes | Name | Format name for private clipboard format |
| Varies | Data | Clipboard data |

*Added beginning with Windows 3.0.

6.017. ICON RESOURCE FILE FORMAT

| Off. | set Length | Name | Description |
|------|------------|------------------|---|
| 0 | (0) WORD | icoReserved | RESERVED; must be set to 0 |
| 2 | (2) WORD | icoResourceType | Type of resource contained in file; must be 1 |
| 4 | (4) WORD | icoResourceCount | Number of arrays (Icons) in file |
| 6 | (6) Varies | icoResourceArray | |

| Length | Name | Description |
|--------|--------------|--|
| BYTE | Width | Width, in pixels, of icon image (16,32, or 64) |
| BYTE | Height | Height, in pixels, of icon (16, 32, or 64) |
| BYTE | ColorCount | Number of colors in icon (2, 8, or 16) |
| BYTE | RESERVED | |
| WORD | RESERVED | |
| | RESERVED | |
| | | Size of pixel array, in bytes |
| DWORD | icoDIBOffset | Offset, in bytes, to pixel array |

A DIB for a color icon consists of 1) XOR mask bitmap; 2) AND mask (monochrome). Note:

Microsoft Windows 3.0 SDK Programmer's Reference, pages 9-2 through 9-3 Source:

See Also: 6.018. Cursor Resource File Format

6.018. CURSOR RESOURCE FILE FORMAT

| Offset | Length | Name | Description |
|--------|--------|------------------|---|
| 0 (0) | WORD | curReserved | RESERVED; must be set to 0 |
| 2 (2) | WORD | curResourceType | Type of resource contained in file; must be 2 |
| 4 (4) | WORD | curResourceCount | Number of arrays (cursors) in file |
| 6 (6) | Varies | curResourceArray | |

| Length | Name | Description |
|--------|--------------|--|
| BYTE | curWidth | Width, in pixels, of cursor image |
| BYTE | curHeight | Height, in pixels, of cursor |
| BYTE | ColorCount | Number of colors in cursor (2, 8, or 16) |
| BYTE | RESERVED | |
| WORD | curXHotspot | Horizontal hotspot, in pixels |
| WORD | curYHotspot | Vertical hotspot, in pixels |
| DWORD | curDIBSize | Size of pixel array, in bytes |
| DWORD | curDIBOffset | Offset, in bytes, to pixel array |

Note: Cursors consist of 1) XOR mask bitmap; 2) AND mask (both monochrome).

6.021, SINGLE-LINE RESOURCE STATEMENTS (ICON, CURSOR, BITMAP, FONT)

General Single Statement Resource Script Format:

nameID resourcetype [loadoption] [memoryoption] filespec

| Item | Description | Allowable Values |
|--------------|--|--|
| nameID | Name or number used to identify resource | For FONT resource, must be an integer number |
| resourcetype | Type of resource being defined | One of: CURSOR ICON BITMAP FONT |
| loadoption | Specifies when resource is to be loaded | One of: PRELOAD (loaded immediately) LOADONCALL (default: loaded only when called) |
| memoryoption | Determines how resource is treated in memory | One of: FIXED (remains in fixed location) MOVEABLE (may be moved in memory) DISCARDABLE (may be discarded from memory) |
| filespec | Name and extension of file containing resource | |

Examples:

5 FONT CMMODERN.FNT cursor CURSOR custom.cur desk ICON DISCARDABLE desk.ico

See Also: 6.020. Resource Script File Directives

6.022. RCDATA RESOURCE SCRIPT DEFINITIONS

General RCDATA Resource Script Format: nameID RCDATA [load-option][mem-option] **BEGIN** raw-data END

| Item | Description | Allowable Values |
|-------------|--|---|
| nameID | Name or number used to identify resource | |
| load-option | Specifies when resource is to be loaded | PRELOAD (loaded immediately) |
| | | LOADONCALL (default: loaded when called) |
| mem-option | Determines how resource is treated in memory | FIXED (remains in fixed location) |
| 1 | | MOVEABLE (may be moved to compact memory) |
| | | DISCARDARI E (may be discarded when not needed) |

Version: Applies to all versions of Windows beginning with 3.0.

Source: Microsoft Windows 3.0 SDK Programmer's Reference, pages 8-4 through 8-5

See Also: 6.020. Resource Script File Directives

6.023. MENU RESOURCE SCRIPT DEFINITIONS

General MENU Resource Script Format: menuID MENU [load-option] [mem-option] BEGIN

menuitems END

optionlist2:

| Item | Description | Allowable Values | |
|-------------|---|--|--|
| menulD | Name or number used to Identify menu resource | | |
| load-option | Specifies when resource is to be loaded | PRELOAD (loaded immediately) | |
| | | LOADONCALL (default: loaded when called) | |
| mem-option | Determines how resource is treated in memory | FIXED (remains in fixed location) | |
| 1 | · · | MOVEABLE (may be moved to compact memory) | |
| | | DISCARDABLE (may be discarded when not needed) | |

Allowable Menuitems Menuitem Name MENUITEM Syntax Description MENUITEM text, result, optionlist1 Defines a menu item POPUP POPUP text, optionilist2 BEGIN definitions END Defines a popup menu definition Special "dividing" menu item, usually a horiz, bar

optionlist1: MENUBREAK

Item is immediately preceded by a new line Same as MENUBREAK, but places vertical line MENUBARBREAK

between columns

CHECKED Item has a checkmark next to it INACTIVE GRAYED

Item is displayed, but cannot be selected

Item is inactive and displayed "grayed" (disabled)
Item has vertical separator to its left

HELP

MENUBREAK

Item is placed in new column MENUBARBREAK Same as MENUBREAK, but places vertical line

between columns

CHECKED Item has a checkmark next to it

Item is displayed, but cannot be selected INACTIVE GRAYED Item is inactive and displayed "graved" (disabled)

text: ASCII string (in quotes)

result: Integer number of result to return when user selects Item

6.024. DIALOG RESOURCE SCRIPT DEFINITIONS

General DIALOG Resource Script Format: nameID DIALOG [loadoption] [memoryoption] x,y,width,height optionstatements BEGIN

controlstatements

END

| Item | Description | Allowable Values |
|---|---|---|
| nameID | Name or number used to identify dialog | |
| loadoption Specifies when resource is to be loaded PRELOAD (loaded in | | PRELOAD (loaded immediately) |
| | | LOADONCALL (default: loaded when called) |
| memoryoption | Determines how resource is treated in memory | FIXED (remains in fixed location) |
| , | · · · · · · · · · · · · · · · · · · · | MOVEABLE (may be moved to compact memory) |
| | | DISCARDABLE (may be discarded when not needed) |
| optionstatements | Define special attributes of dialog box | STYLE (defines style of dialog box) |
| | _ ' | CAPTION text (defines dialog box's title) |
| | | MENU name (defines dialog box's menu) |
| | l . | CLASS class (defines dialog box's class) |
| | | FONT point size, typeface (defines dialog box's font) |
| controlstatements | Define attributes of controls within dialog box | See 6.025. Dialog Box Control Definitions |

Default STYLE is: WS_POPUP WS_BORDER WS_SYSMENU Note:

6.025. DIALOG BOX CONTROL DEFINITIONS

General Resource Script Format: CONTROLNAME text, id, xposition, yposition, width, height, [style]

| Control Name | Class | Appears As | Syntax | Default Style |
|---------------|-----------|------------------------|-------------------------------------|----------------------------------|
| LTEXT | Static | Left-justified text | LTEXT text,id,x,y,w,h,[style] | SS_LEFT, WS_GROUP |
| RTEXT | Static | Right-justified text | RTEXT text,id,x,y,w,h,[style] | SS_RIGHT, WS_GROUP |
| CTEXT | Static | Centered text | CTEXT text,id,x,y,w,h,[style] | SS CENTER, WS GROUP |
| CHECKBOX | Button | Check box with text | CHECKBOX text,id,x,y,w,h,[style] | BS_CHECKBOX, WS_TABSTOP |
| PUSHBUTTON | Button | Push button with text | | BS_PUSHBUTTON, WS_TABSTOP |
| LISTBOX | Listbox | Boxed list of strings | LISTBOX id,x,y,w,h,[style] | LBS NOTIFY,WS VSCROLL, WS BORDER |
| GROUPBOX | Button | Group of buttons | GROUPBOX text,id,x,y,w,h,[style] | BS GROUPBOX, WS TABSTOP |
| DEFPUSHBUTTON | Button | Default push button | | BS DEFPUSHBUTTON, WS TABSTOP |
| RADIOBUTTON | Button | Radio button with text | | BS_RADIOBUTTON, WS_TABSTOP |
| COMBOBOX† | Combobox | Boxed list with text | COMBOBOX id, x,y,w,h,[style] | WS_TABSTOP, CBS_SIMPLE |
| SCROLLBART | Scrolibar | Scrollbar with thumb | SCROLLBAR id, x,y,w,h,[style] | SBS HORZ |
| EDITTEXT | Edit | Boxed text | EDITTEXT id,x,y,w,h,[style] | WS_TABSTOP, ES_LEFT, WS_BORDER |
| ICON | Static | Icon | ICON text,id,x,y,w,h,[style] | SS_ICON |
| CONTROL | Varies | User-defined window | CONTROL text,id,class,style,x,y,w,h | none |

| Style Name | Class | Description | |
|-----------------------|---------|---|--|
| BS 3STATE | Button | Same as BS_CHECKBOX except button can be "grayed" | |
| S AUTO3STATE | Button | Same as BS_3STATE except that button automatically toggles state when user clicks on it | |
| S_AUTOCHECKBOX | Button | Button automatically toggles state when user clicks on it | |
| IS AUTORADIOBUTTON* | Button | Button checked, application notified, all other radio buttons in group unchecked | |
| S CHECKBOX | Button | Same as CHECKBOX | |
| IS DEFPUSHBUTTON | Button | Same as DEFPUSHBUTTON | |
| IS GROUPBOX | Button | Same as GROUPBOX | |
| S LEFTTEXT* | Button | Causes text to appear to left of button (used with CHECKBOX, 3STATE, or RADIOBUTTON) | |
| S OWNERDRAW† | Button | Owner-drawn button handled by parent window | |
| IS PUSHBOX* | Button | Same as PUSHBUTTON, but no border drawn | |
| IS PUSHBUTTON | Button | Same as PUSHBUTTON | |
| IS RADIOBUTTON | Button | Same as RADIOBUTTON | |
| IS USERBUTTON | Button | User-defined button; parent notified when clicked | |
| S LOCALEDIT | Dialog | Edit controls in dialog box will use memory from application's data segment | |
| S MODALFRAME | Dialog | Modal dialog box frame | |
| S NOIDLEMSG | Dialog | Supress WM_ENTERPRISE messages to dialog box | |
| S SYSMODAL | Dialog | Creates a system modal dialog box | |
| S AUTOHSCROLL | Edit | Text scrolled 10 chars right at end of line, to 0 when CR pressed | |
| S AUTOVSCROLL | Edit | Text scrolled up one "page" when user presses CR on last line | |
| S CENTER | Edit | Centered text | |
| S LEFT | Edit | Left-justified text | |
| S_LOWERCASE† | Edit | Lowercase edit control | |
| S MULTILINE | Edit | Multiline edit control | |
| S NOHIDESEL | Edit | Overrides hiding and inverting of text as focus moves to and from text | |
| S OEMCONVERT† | Edit | Text converted from ANSI to OEM character set and back | |
| S PASSWORD† | Edit | Displays all characters as asterisk as they are typed | |
| S RIGHT | Edit | Right-justified text | |
| S UPPERCASE† | Edit | Uppercase edit control | |
| BS EXTENDEDSELT | Listbox | Select multiple items with Shift and/or Control key | |
| BS HASSTRINGS† | Listbox | Contains items consisting of strings | |
| BS MULTICOLUM† | Listbox | Listbox contains multiple columns | |
| BS MULTIPLESEL | Listbox | String selection toggled when user clicks or double clicks | |
| BS NOINTEGRALHEIGHT1 | Listbox | Size of listbox controlled by application | |
| BS NOREDRAW | Listbox | Listbox display not updated when changes are made | |
| BS NOTIFY | Listbox | Parent receives message when user clicks or double clicks string | |
| BS_OWNERDRAWFIXED† | Listbox | Owner of listbox responsible for drawing | |
| BS_OWNERDRAWVARIABLE† | Listbox | Owner of listbox responsible for drawing; items are variable height | |
| BS SORT | Listbox | Strings are listed in box alphabetically | |
| BS STANDARDT | Listbox | SORT, NOTIFY, BORDER, VSCROLL | |
| BS USETABSTOPS! | Listbox | Listbox expands tab chars when drawing strings | |

6.025. DIALOG BOX CONTROL DEFINITIONS (continued)

| Control Styles I | continued |) |
|------------------|-----------|---|
|------------------|-----------|---|

| Style Name | Class | Description | | |
|----------------------------|-----------|---|--|--|
| BS_WANTKEYBOARDINPUT† | Listbox | Owner of listbox receives WM_VKEYTOITEM or WM_CHARTOITEM messages on keypress | | |
| BBS_BOTTOMALIGN | Scrollbar | Used with SBS_HORZ; bottom edge is bottom edge of rectangle | | |
| SBS_HORZ | Scrollbar | Horizontal scroll bar | | |
| BBS_LEFTALIGN | Scrolibar | Used with SBS_VERT; left edge is left edge of rectangle | | |
| BS_RIGHTALIGN | Scrollbar | Used with SBS_VERT; right edge is right edge of rectangle | | |
| BBS_SIZEBOX | Scrollbar | Size box | | |
| BS_SIZEBOXBOTTOMRIGHTALIGN | Scrolibar | Used with SBS_SIZEBOX; aligns sizebox to bottom right corner of rectangle | | |
| BS_SIZEBOXTOPLEFTALIGN | Scrollbar | Used with SBS_SIZEBOX; aligns sizebox to top left comer of rectangle | | |
| BS_TOPALIGN | Scrolibar | Used with SBS_HORZ; top edge is top edge of rectangle | | |
| BS_VERT | Scrollbar | Vertical scroll bar | | |
| S_BLACKFRAME | Static | Box with frame the color of window frame | | |
| S BLACKRECT | Static | Rectangle filled with color of window frame | | |
| S CENTER | Static | Same as CENTER | | |
| S GRAYFRAME | Static | Box with frame the color of desktop | | |
| S GRAYRECT | Static | Rectangle filled with color of desktop | | |
| SICON | Static | Same as ICON | | |
| S LEFT | Static | Same as LTEXT | | |
| S LEFTNOWORDWRAP† | Static | Same as LTEXT, but words not wrapped | | |
| NOPREFIXT | Static | & characters not integreted as accelerators | | |
| RIGHT | Static | Same as RTEXT | | |
| S SIMPLE† | Static | Same as LTEXT, but text channot be altered | | |
| SUSERITEM | Static | User-defined static item | | |
| WHITEFRAME | Static | Box with frame the color of window background | | |
| WHITERECT | Static | Rectangle filled with color of window background | | |
| S BORDER* | All | Creates window that has a border | | |
| S CAPTION* | All | Creates window that has a title bar (implies WS_BORDER) | | |
| S CHILD* | All | Creates child window (cannot be used with WS_POPUP) | | |
| S CHILDWINDOW* | All | Creates child window with style WS CHILD | | |
| S CLIPCHILDREN* | All | Excludes the area occupied by child window when drawing parent window | | |
| S CLIPSIBLINGS* | All | Clips child windows relative to each other | | |
| S DISABLED* | All | Creates window that is initially disabled | | |
| S DLGFRAME* | All | Creates window with a double border but no title | | |
| S GROUP | Ali | First control of group in which user may move using cursor keys | | |
| S HSCROLL* | All | Creates window with horizontal scroll bar | | |
| S ICONIC* | All | Creates window that is initially iconic (use with WS_TOPLEVEL only) | | |
| | | | | |
| S_ICONICPOPUP*§ | All | Creates iconic pop-up window | | |
| S_MAXIMIZE* | All | Creates window of maximum size | | |
| S_MAXIMIZEBOX | All | Creates window that has a Maximize box | | |
| S_MINIMIZE | All | Creates window of minimum size | | |
| MINIMIZEBOX | All | Creates window that has a Minimize box | | |
| S_OVERLAPPED | All | Creates overlapping window | | |
| S_OVERLAPPEDWINDOW | All | Creates overlapped window with: WS_OVERLAPPED,WS_SYSMENU, WS_CAPTION, WS_SIZEBOX, WS_THICKFRAME, WS_MINIMIZEBOX, WS_MAXIMIZEBOX | | |
| S POPUP* | All | Creates pop-up window (cannot be used with WS CHILD) | | |
| S POPUPWINDOW* | All | Creates pop-up window with: WS_POPUP, WS_BORDER, WS_SYSMENU | | |
| S SIZEBOX* | All | WS THICKFRAME | | |
| S SYSMENU* | All | Creates window that has a system menu box in its title bar | | |
| S TABSTOP | All | Control in which user may move using Tab key | | |
| S THICKFRAME† | All | Creates window with thick frame for resizing window | | |
| S TOPLEVEL*§ | All | Creates top-level window | | |
| S TOPLEVEL § | All | Creates window with: WS TOPLEVEL, WS CAPTION, WS SYSMENU, WS SIZEBOX | | |
| | | | | |
| S VISIBLE* | All | Creates window that is initially visible (applies to toplevel and popup windows) | | |

6.026. ACCELERATORS RESOURCE SCRIPT DEFINITIONS

General ACCELERATOR Resource Script Format: tablename ACCELERATORS BEGIN

event, idvalue [.type][,NOINVERT][,ALT][,SHIFT][,CONTROL]

| Item | Description | Allowable Values |
|-----------|--|--|
| tablename | Name of accelerator table | |
| event | Keystroke to be used as accelerator | "char" or "^char" (single character, control char) ASCII character code Virtual key character |
| Idvalue | ID of accelerator keystroke | Integer value |
| type | Defines keytype of accelerator | Not used if using quoted chars (e.g., "^C") ASCII (if ASCII character code) VIRTKEY (if Virtual key character) |
| NOINVERT | Defines whether top-level menu is highlighted on key | If omitted, top-level menu is highlighted if included, top-level menu is not highlighted |
| ALT† | Defines if accelerator requires Alt key down | If omitted, Ait key need not be down If included, Ait key must be down |
| SHIFT | Defines if accelerator requires Shift key down | If omitted, Shift key need not be down If included, Shift key must be down |
| CONTROL | Defines if accelerator requires Control key down | If omitted, Control key shouldn't be down If Included, Control key must also be down |

†First defined in Windows 3.0.

Note:

More than one key may be defined at once by including additional 'event' statements between the BEGIN and END statements.

6.027. COMMON MENU ACCELERATOR KEY DEFINITIONS

Edit Menu in Early Windows Versions

| Key Name | Action Performed in Windows 1 | Action Performed in Windows 2 |
|------------------|---------------------------------------|---------------------------------------|
| Shift + Escape | Invokes the Edit menu's Undo command | Selects system menu of active window |
| | Not defined | Invokes the Edit menu's Undo command |
| Delete | Invokes the Edit menu's Cut command | Invokes the Edit menu's Clear command |
| F2 | Invokes the Edit menu's Copy command | Not defined |
| Insert + Control | Invokes the Edit menu's Paste command | Invokes the Edit menu's Copy command |
| Shift + Delete | Invokes the Edit menu's Clear command | Invokes the Edit menu's Cut command |
| Shift + Insert | Not defined | Invokes the Edit menu's Paste command |

| | | nitions |
|--|--|---------|
| | | |

| Key Name | Action | Description |
|-----------------|-------------------|---|
| none | File menu | |
| none | New | Creates new file |
| none | Open | Opens existing file |
| none | Save | Saves existing file |
| none | Save as | Saves into new file |
| none | Print | Prints existing file |
| none | Exit (optional) | Ends active application |
| none | Edit menu | |
| Alt+Backspace | Undo | Reverses last action |
| Shift+Del | Cut | Removes selected object(s), coples to clipboard |
| Ctrl+Ins | Сору | Copies selected object(s) to clipboard |
| Shift+Ins | Paste | Pastes object(s) from clipboard |
| Del (optional) | Clear (optional) | Removes selected object(s), not to clipboard |
| Del (optional) | Delete (optional) | Removes selected object(s), not to clipboard |
| none | View menu | |
| none | Options menu | |
| none | Window menu | |
| none | Help menu | |
| Shift+F10 | Help | Describes how to get help |
| F2 | Extended Help | Provides Info about tasks application performs |
| F9 | Keys help | Gives listing of all key assignments |
| F11 | Help Index | Gives listing of all help topics |
| Shift+F2 | Tutorial | Provides tutorial for current point of focus |
| none | About | Displays application logo and info |
| Alt+Spacebar | System Menu | |
| Shift+Esc | System Menu | |
| none | Restore | Returns primary window to previous size |
| none | Move | Repositions window on screen |
| none | Size | Changes dimensions of window |
| none | Minimize | Removes all windows and replaces with Icon |
| none | Maximize | Enlarges window to largest possible size |
| Alt+F4, Ctrl+F4 | Close | Removes active and associated windows |
| Ctrl+Esc | Switch to | Shows dialog of active applications |
| none | Split (optional) | Shows document in multiple views |
| F5 (optional) | Refresh | |

Section Header: (norts)

| Option | Function | Syntax | Allowable values |
|----------|-----------------------|--|------------------------------------|
| Portname | Defines port settings | Portname:=baud,parity,wordlen,stopbits,p | Baud: actual baud rate (e.g., 300) |
| | - | | Parity: o, e, n (odd, even, none) |
| | l | | Wordlen: # of bits (e.g., 8) |
| 1 | Į. | 1 | Stopbits: # of bits (e.g., 2) |
| | l . | | p: hardware handshaking |

Note:

• 'Portname' must be one of the recognized DOS ports (e.g., COM1), or EPT: or FILE::
• Alternatively, 'portname' may be a filename, in which case output may be sent directly to a file.

6.038. DATA TYPES USED IN WINDOWS ARGUMENT NAMES

| Prefix Used | Meaning | Size | Comments |
|-------------|------------------------------|-------|---|
| ь | Boolean value | WORD | 0=false; non-zero=true |
| С | Character | BYTE | See 6.09. Extended ANSI Character Codes |
| dw | Long unsigned integer value | DWORD | Unsigned values |
| f | Bit flag value | WORD | 16 Individual flags |
| h | Handle | WORD | Handle is an index into a table |
| 1 | Long integer value | DWORD | Signed values |
| Πp | Long pointer | DWORD | Far pointer |
| n | Short Integer value | WORD | Signed values |
| P | Short pointer | WORD | Near pointer |
| pt | x,y coordinate point | DWORD | Unsigned, 2-word values |
| rgb | RGB color value | DWORD | Unsigned |
| w | Short unsigned integer value | WORD | Unsigned values |

Note: The letters in the left column are used as prefixes to an argument name, as in

IpMinPos (e.g., MinPos is a long pointer argument).

| LPLOGPEN | Long pointer to LOGPEN | DWORD | N N | See 6.065, LOGPEN Structure Format |
| LPMEASUREITEMSTRUCT | Long pointer to MEASUREITEMSTRUCT | DWORD | l N | See 6.067, MEASUREITEMSTRUCT Structure Format |
| LPMETAFILEPICT | Long pointer to MEASURETEMSTRUCT | DWORD | N N | See 6.069, METAFILEPICT Structure Format |

6.039. DATA TYPES AVAILABLE AS C KEYWORDS (continued)

| Keyword | Meaning | Size | Signed | Comments |
|-----------------|-------------------------------------|-------|--------|---|
| LPMSG | Long pointer to MSG struct. | DWORD | N | Data may be in another segment |
| LPOFSTRUCT | Long pointer to OFSTRUCT | DWORD | N | See 6.072. OFSTRUCT Structure Format |
| LPPAINTSTRUCT | Long pointer to PAINTSTRUCT | DWORD | N | See 6.073. PAINTSTRUCT Structure Format |
| LPPALETTEENTRY* | Long pointer to PALETTEENTRY | DWORD | N | See 6.074. PALETTEENTRY Structure Format |
| LPPOINT | Long pointer to POINT struct. | DWORD | N | See 6.075. POINT Structure Format |
| LPRECT | Long pointer to RECT struct. | DWORD | N | Data may be in another segment |
| LPRESOURCELIST | Long pointer to RESOURCELIST | DWORD | N | |
| LPSTR | Long pointer to char string | DWORD | N | Data may be in another segment |
| LPTEXTMETRIC | Long pointer to TEXTMETRIC | DWORD | N | See 6.080. TEXTMETRIC Structure Format |
| LPVOID | Long pointer to undefined data type | DWORD | N | |
| LPWNDCLASS | Long pointer to WNDCLASS | DWORD | Ň | See 6.081, WNDCLASS Structure Format |
| NEAR | Short pointer | WORD | N | Cast as a short pointer (data in current segment) |
| NPSTR | Near pointer to character string | WORD | N | |
| PINT | Pointer to 16-bit integer | WORD | N | Data is assumed within current segment |
| PSTR | Pointer to character string | WORD | N | Data is assumed within current segment |
| PWORD | Pointer to unsigned 16-bit Integer | WORD | N | |
| short | Signed word Integer | WORD | Y | |
| vold | Empty value | | N | |
| WORD | Unsigned word Integer | WORD | N | |

6.040. WINDOWS HANDLE AND POINTER TYPES

| Name | Function |
|--------------|--|
| FAR | Data type attribute that can be used to create a long pointer |
| FARPROC | Long pointer to a function |
| GLOBALHANDLE | Global memory handle; index to memory block in system's global heap |
| HANDLE | General handle; Index to table entry identifying program data |
| HBITMAP | Physical bitmap handle; index to GDI's physical drawing objects |
| HBRUSH | Physical brush handle; index to GDI's physical drawing objects |
| HCURSOR | Cursor resource handle; Index to a resource table entry |
| HDC | Display context handle; index to GDI's display context tables |
| HFONT | Physical font handle; index to GDI's physical drawing objects |
| HICON | icon resource handle; index to a resource table entry |
| HMENU | Menu resource handle; index to a resource table entry |
| HPEN | Physical pen handle; Index to GDI's physical drawing objects |
| HRGN | Physical region handle; index to GDI's physical drawing objects |
| HSTR | String resource handle; index to a resource table entry |
| LOCALHANDLE | Local memory handle; index to memory block in application's local heap |
| LPINT | Long pointer to a signed 16-bit integer |
| LPMSG | Long pointer to MSG data structure |
| LPRECT | Long pointer to RECT data structure |
| LPSTR | Long pointer to a character string |
| NEAR | Data type attribute that can be used to create a short pointer |
| PINT | Pointer to a signed 16-bit integer |
| PSTR | Pointer to a character string |

Note: All handles are 16-bit values.

6.043. BITMAP STRUCTURE FORMAT

| Field Type | Argument Type | Description | Restrictions on Allowable Values |
|------------|---------------|---|---|
| | bmType | Bitmap type | Must be 0 for logical bitmaps |
| | | Width of bitmap in pixels | Must be greater than 0 |
| | bmHelght | Height of bitmap in raster lines | Must be greater than 0 |
| | bmWidthBytes | Number of bytes per raster line | Must be an even number |
| BYTE | bmPlanes | Points to number of color planes in bitmap | |
| | bmBitsPixel | Points to number of adjacent color bits on each plane | |
| LPSTR | bmBits | | Pointer to array of BYTE values comprising bitman |

Note: In monochrome bitmap, a one-bit, one-plane format is used; bit=1 means pixel is white (on).

| BYTE | ByteSize | Number of bits in transmitted char | Must in range 4 to 8 |
| BYTE | Parity | Parity scheme to use | Must be one of: NOPARITY (0) ODDPARITY (1) EVENPARITY (2) MARKPARITY (3) SPACEPARITY (4) |
| BYTE | StopBits | Number of stop bits in transmitted char | Must be one of: ONESTOPBIT (0) ONE5STOPBITS (1) TWOSTOPBITS (2) |
| WORD | RisTimeout | Milliseconds to wait for CD to go high | |
| WORD | CtsTimeout | Milliseconds to wait for CTS to go high | |
| WORD | DsrTimeout | Milliseconds to walt for DSR to go high | |
| BYTE | Bit 7:fBinary | Is binary mode? | 0=ASCII mode; 1=binary mode |
| | Bit 6:fRtsDisable | is RTS disabled? | 0=RTS enabled: 1=RTS disabled |
| | Bit 5:fParity | is parity checking enabled? | 0=parity not checked; 1=parity enabled |
| 1 | Bit 4:fOutxCtsFlow | Monitor CTS for output flow control? | 0=don't monitor CTS; 1=monitor CTS |
| l | Bit 3:fOutxDsrFlow | Monitor DSR for output flow control? | 0=don't monitor DSR; 1=monitor DSR |
| i | Bits 1-2: fDummy | Place holder only | |
| Į. | Bit 0:fDtrDisable | Is DTR enabled? | 0=DTR enabled; 1=DTR not enabled |
| BYTE | Bit 7:fOutX | Use XON/XOFF during transmission? | 0=don't use; 1=use XON/XOFF |
| 1 | Bit 6:finX | Use XON/XOFF during reception? | 0=don't use; 1=use XON/XOFF |
| | Bit 5:fPeChar | Replace parity chars with PeChar? | 0=don't replace; 1=replace chars with parity error |
| | Bit 4:fNull | Discard NULL characters? | 0=don't discard; 1=discard NULL characters |
| | Bit 3:fChEvt | Flag EvtChar as an event? | 0=don't flag; 1=EvtChar indicates event |
| | Bit 2:fDtrFlow | Monitor DTR for Input flow control? | 0=don't monitor DTR; 1=monitor DTR |
| | Bit 1:fRtsFlow | Monitor RTS for input flow control? | 0=don't monitor RTS; 1=monitor RTS |
| | Blt 0:fDummy2 | Place holder only | |
| char | XonChar | XON character for transmit & receive | ASCII value |
| char | XoffChar | XOFF character for transmit & receive | ASCII value |
| WORD | XonLim | Min. chars in receive queue before XON | |
| WORD | XoffLim | Max. chars in receive queue before XOFF | |
| char | PeChar | Character that replaces parity errors | ASCII value |
| char | EofChar | Character that signals an event | ASCII value |
| char | EvtChar | Character that signals end-of-data | ASCII value |
| WORD | TxDelay | Min. milliseconds between transmissions | |

Version: Applies to all versions of Windows beginning with 2.0.

Note: Numbers in parentheses show actual values.

6.056. DLGTEMPLATE STRUCTURE FORMAT

DLGTEMPLATE Header

| Field Type | Argument Type | Description | Restrictions on Allowable Values |
|------------|-----------------|--|----------------------------------|
| long | dtStyle | Style of dialog box | DS LOCALEDIT |
| 1 | | | DS SYSMODAL |
| l | | i e | DS MODALFRAME |
| l | | | DS_ABSALIGN |
| ŀ | i | | DS_SETFONT |
| 1 | | | DS_NOIDLEMSG |
| BYTE | dtitemCount | Number of items in dialog box (controls) | Max 255 |
| int | dtX | x-coordinate of upper-left comer of box | In units of 1/4 base width unit |
| int | dtY | y-coordinate of upper-left comer of box | In units of 1/8 base height unit |
| int | diCX | x-extent of the dialog box | In units of 1/4 base width unit |
| int | diCY | y-extent of the dialog box | In units of 1/8 base height unit |
| char | dtMenuName[] | Name of dialog box's menu | ASCIIZ string |
| char | dtClassName[] | Dialog's class name | ASCIIZ string |
| char | dtCaptionText[] | Caption string for dialog box | ASCIIZ string |

Font Information Data Structure (optional) follows header, as follows:

| Field Type | Argument Type | Description | Restrictions on Allowable Values |
|------------|---------------|------------------|----------------------------------|
| short int | PointSize | | In points |
| char | szTypeFace[] | Name of typeface | ASCIIZ string |

Item List (of Controls) follows font information, with each item containing:

| Field Type | Argument Type | Description | Restrictions on Allowable Values |
|------------|---------------|---|---|
| nt | dtiiX | x-coordinate of upper-left corner of item | (Relative to origin of box) |
| | ŀ | | In units of 1/4 base width unit |
| nt | dtilY | y-coordinate of upper-left comer of item | (Relative to origin of box) |
| | | | In units of 1/8 base height unit |
| nt | dtilCX | x-extent of item | In units of 1/4 base width unit |
| nt | dtilCY | y-extent of item | In units of 1/8 base height unit |
| nt | dtillD | Dialog item ID number | |
| ong | dtilStyle | Style of the dialog item | |
| char | dtilClass[]* | Control's class | ASCIIZ string; one of: BUTTON, EDIT, STATIC, LISTBOX, SCROLLBAR, COMBOBOX |
| har | dtilText | Text for the item (if any) | ASCIIZ string |
| BYTE | dtillnfo | Number of bytes to next item in structure | |
| PTR | dtilData* | Pointer to additional data for CreateWindow | |

*Added in Windows 3.0.

Version: Applies to all versions of Windows beginning with 2.0.

Note: dtMenuName was dtResourceName in Windows 2.x.

6.058. EXTTEXTMETRIC STRUCTURE FORMAT

| Field Type | Argument Type | Description | Restrictions on Allowable Values |
|------------|-------------------------------|---|---|
| Short | etmsize | Size of EXTTEXTMETRIC structure | |
| Short | etmPointSize | Font's point size in twips | |
| Short | etmOrientation | Font orientation | 1=portrait, 2=landscape, 0=either |
| Short | etmMasterHeight | Font height in device units | |
| Short | etmMinScale | Mmin range of device units for font | |
| Short | etmMaxScale | Mmax range of device units for font | |
| Short | etmMasterUnits | Number of units per em | |
| Short | etmCapHeight | Height of uppercase letters | In font units, typically height of 'H' |
| Short | etmXHeight | Height of lowercase letters | In font units, typically height of 'x' |
| Short | etmLowerCaseAscent | Distance ascenders above baseline | In font units, typically ascent of 'd' |
| Short | etmUpperCaseDescent | Distance descenders below baseline | In font units, typically descent of 'p' |
| Short | etmSlant | Angle counterclockwise from vert. | In degrees |
| Short | etmSuperScript | Distance above baseline | Specified as negative offset |
| Short | etmSubScript | Distance below baseline | Specified as positive offset |
| Short | etmSuperScriptSize | Recommended size of superscripts | |
| Short | etmSubScriptSize | Recommended size of subscripts | |
| Short | etmUnderlineOffset | Distance below baseline to top of line | |
| Short | etmUnderlineWidth | Thickness of underline | |
| Short | etmDoubleUpperUnderlineOffset | Distance below baseline to top of line | |
| Short | etmDoubleLowerUnderlineOffset | Distance below baseline to top of line | |
| Short | etmDoubleUpperUnderlineWidth | Thickness of underline | |
| Short | etmDoubleLowerUnderlineWidth | Thickness of underline | |
| Short | etmStrikeOutOffset | Distance above baseline to strikeout | |
| Short | etmStrikeOutWidth | Thickness of strikeout line | |
| Short | etmNKernPairs | Number of kerned pairs in font | |
| Short | etmNKernTracks | Number of kerning tracks defined for font | |

Version: Applies to Windows 1.0 only.

Microsoft Windows 2.0 SDK Programmer's Reference, page 630 Microsoft Windows 3.0 SDK Programmer's Reference, page 7-57

6.077. RGB AND COLORREF STRUCTURE FORMAT

Format of the long integer that constitutes a RGB or COLORREF depends upon use, as follows:

RGB Structure Format

| | Byte | | | | |
|---|------|---|----|-------------------------|--------------------------------|
| 3 | 2 | 1 | 0 | Description | Allowable Values |
| X | | | | NOT USED | Must be 00H |
| | X | | | Blue intensity of color | 0=no blue; 0FFH=maximum blue |
| | | X | Π. | | 0=no green; 0FFH=maximum green |
| | | | X | | 0=no red; 0FFH=maximum red |

Palette Index Structure Format

| | Dyle | | | | |
|---|------|---|---|----------------------------|------------------|
| 3 | 2 | 1 | 0 | Description | Allowable Values |
| X | | | | Index Identifier | Must be 01 |
| | _ X_ | | | UNUSED | Must be 00 |
| | | X | X | Index into logical palette | |

Palette-Relative RGB Structure Format

| | Byte | | | | |
|---|------|---------------|---|--------------------------|------------------|
| 3 | 2 | 1 | 0 | Description | Allowable Values |
| X | | | | Identifier | Must be 02H |
| | X | | | Blue Intensity to match | |
| | | X | | Green Intensity to match | |
| | | $\overline{}$ | X | Red Intensity to match | |

Version: •RGB applies to Windows versions 1.0 and 2.0.

COLORREF applies to Windows 3.0 and later.

Note: Black is defined as 0000 0000H; white is defined as 00FF FFFFH; medium gray is defined as 0080 8080H.

medium gray is defined as 0000 6000F

6.084. WINDOW MANAGEMENT MESSAGES (continued)

| Message Name | Purpose | wParam | IParam | Return |
|---------------------|--|--|---|------------------------------|
| WM_ICONERASEBKGND† | Sent when background of icon must be filled before painting | Handle of icon's device context | Not used | None |
| WM_KILLFOCUS | Sent before window loses input focus | Handle of window receiving focus | Not used | None |
| WM_MENUSELECT† | Occurs when user selects a menu item | Item selected | MF BITMAP MF_CHECKED MF_CISABLED MF_GRAYED MF_MOUSESELECT MF_DOWNERDRAW MF_POPUP MF_SYSMENU | None |
| WM_MOVE | Sent when a window is moved | Not used | New upper-left client area location | None |
| WM_PAINT | Occurs when request to repaint window occurs | Not used | Not used¶ | None |
| WM_PAINTICON† | Sent when icon is to be painted | Not used | Not used | None |
| WM_PARENTNOTIFY† | Sent to parent window when child created, destroyed, or mouse active in | Why parent notified: WM_CREATE WM_DESTROY WM_LBUTTONDOWN WM_MBUTTONDOWN WM_RBUTTONDOWN | LO=window handle of child window HO=child window ID If WM_CREATE or WM_DESTROY, LOB is x-coordinate HOB is y-corrdinate | None |
| WM_QUERYDRAGICON† | Sent to minimized window that is about to be dragged (no class icon) | Not used | Not used | LO=cursor handle or NULL |
| WM_QUERYENDSESSION | Occurs when user invokes End Session command | Not used | Not used | ≠0 if shutdown |
| WM_QUERYNEWPALETTE† | Sent to window about to receive input focus | Not used | Not used | TRUE=realized, else FALSE |
| WM_QUERYOPEN | Sent to icon when user requests it be opened | Not used | Not used | Nonzero=openable |
| WM_QUIT | Indicates a request to terminate an application | Exit code in PostQuitMessage call | Not used | None |
| WM_SETFONT† | Specifies font dialog box control is to use when drawing text | Handle of font (NULL=default) | TRUE=control to redraw FALSE=don't redraw | None |
| WM_SETFOCUS | Sent after a window gets the input focus | Handle of window losing focus | Not used | None |
| WM_SETREDRAW | Sets or clears the redraw flag | If nonzero, redraw flag is set | Not used | None |
| WM_SETTEXT | Used to set the text of a window | Not used | Lp to ASCIIZ string of window text | May be error msg |
| WM_SETVISIBLE§ | Sent before a window is made visible or hidden | Nonzero if window visible | Not used | None |
| WM_SHOWWINDOW | Sent when a window is hidden or shown | Nonzero if window being shown Zero if being hidden | 0 if message sent due to ShowWindow Otherwise one of: SW_PARENTCLOSING SW_PARENTOPENING | |
| WM_SIZE | Occurs after size of window has been changed | One of: SIZEICONIC SIZEFULLSCREEN SIZENORMAL SIZEZOOMSHOW SIZEZOOMHIDE | New width and height of client area (width=LO, height=HO) | None |

6.086. INPUT MESSAGES

| Message Name | Purpose | wParam | IParam | Return |
|------------------|---|--|--|---------------------------|
| WM_CHAR | Result of translated WM_KEYUP or WM_KEYDOWN | ASCII value of key | Key info¥ | None |
| WM_CHARTOITEM* | Sent by list box in response to a WM_CHAR message | ASCII value of key | LO=window handle of list box HO=current caret position | Action1 |
| WM_COMMAND | Menu item selected, control passed message to Parent, or accelerator key translated | Either menu item, control ID, or accelerator ID | 0=message f/menu or HO=1 if f/accel otherwise HO=notification code and LO=window handle of control | None |
| WM_DEADCHAR | Result of translated WM_KEYUP or WM_KEYDOWN | Character value of dead key | Key info Y | None |
| WM_GETDLGCODE | Sent by Windows dialog manager to control | Not used | Not used | DLGC valuet |
| WM_GETTEXT | Used to copy text corresponding to a window | Number of bytes to be copied (including ending NULL) | Long pointer to buffer to receive text | Number of bytes copied |
| WM_GETTEXTLENGTH | Used to find length of text associated with a window | Not used | Not used | Length of text |
| wm_hscroll | Occurs when user clicks mouse in scroll bar | One of following scrol-bar codes: SB LINEUP (scroll one line up) SB LINEDOWN (scroll one line down) SB PAGEUP (scroll one page up) SB PAGEUP (scroll one page up) SB THUMBPRACK (thumb dragged) SB TOP (scroll to upper left) SB BOTTOM (scroll to lower right) SB ENDSCROLL (end of scroll) | | None |
| WM KEYDOWN | Sent when nonsystem key pressed | Virtual key code of the key pressed | Key info¥ | None |
| WM KEYUP | Sent when nonsystem key released | Virtual key code of the key released | Key info¥ | None |
| WM_LBUTTONDBLCLK | Sent when user double clicks left mouse button | One of the following: MK_RBUTTON (middle button down) MK_MBUTTON (middle button down) MK_LBUTTON (left button down) MK_SHIFT (Shift key down) MK_CONTROL (Control key down) | LO=x coordinate of mouse cursor HO=y coordinate of mouse cursor (Coordinates relative to top left corner of window) | None |
| WM_LBUTTONDOWN | Sent when left mouse button pressed | One of the following: MK_RBUTTON (right button down) MK_MBUTTON (middle button down) MK_SHIFT (Shift key down) MK_CONTROL (Control key down) | LO=x coordinate of mouse cursor HO=y coordinate of mouse cursor (Coordinates relative to top left corner of window) | None |

6.086. INPUT MESSAGES (continued)

| Message Name | Purpose | wParam | IParam | Return |
|-------------------|---|--|--|------------------------------|
| WM_LBUTTONUP | Sent when left mouse button released | One of the following: MK_RBUTTON (right button down) MK_MBUTTON (middle button down) MK_SHIFT (Shift key down) MK_CONTROL (Control key down) | HO=y coordinate of mouse cursor (Coordinates relative to top left corner of window) | None |
| WM_MBUTTONDBLCLK | Sent when user double clicks middle mouse button | One of the following: MK_RBUTTON (right button down) MK_MBUTTON (middle button down) MK_LBUTTON (left button down) MK_SHIFT (Shift key down) MK_CONTROL (Control key down) | LO=x coordinate of mouse cursor HO=y coordinate of mouse cursor (Coordinates relative to top left corner of window) | None |
| WM_MBUTTONDOWN | Sent when middle mouse button pressed | One of the following: MK_RBUTTON (right button down) MK_BUTTON (left button down) MK_SHIFT (Shift key down) MK_CONTROL (Control key down) | LO=x coordinate of mouse cursor HO=y coordinate of mouse cursor (Coordinates relative to top left corner of window) | None |
| wm_mbuttonup | Sent when middle mouse button released | One of the following: MK_RBUTTON (right button down) MK_LBUTTON (left button down) MK_SHIFT (Shift key down) MK_CONTROL (Control key down) | LO=x coordinate of mouse cursor HO=y coordinate of mouse cursor (Coordinates relative to top left corner of window) | None |
| WM_MENUCHAR§ | Sent when user presses mnemonic char not matching those predefined | ASCII char user pressed | HO=handle of menu LO=MF_POPUP or MF_SYSMENU Upon return, HO of return value should contain: 0-discard character and beep 1=close current menu 2=LO has selected menu item-number | <see td="" param<=""></see> |
| WM_MOUSEACTIVATE* | Sent when cursor in inactive window with mouse down | Handle to topmost parent window of activated window | LO=hit-test area code HO=mouse message number | " |
| WM_MOUSEMOVE | Sent when mouse is moved | One of the following: MK_RBUTTON (right button down) MK_MBUTTON (middle button down) MK_LBUTTON (left button down) MK_SHIFT (Shift key down) MK_CONTROL (Control key down) | LO=x coordinate of mouse cursor HO=y coordinate of mouse cursor (Coordinates relative to top left corner of window) | None |
| WM_RBUTTONDBLCKL | Sent when right mouse button is doubled clicked | One of the following: MK_RBUTTON (right button down) MK_MBUTTON (with button down) MK_BUTTON (left button down) MK_SHIFT (Shift key down) MK_CONTROL (Control key down) | LO=x coordinate of mouse cursor HO=y coordinate of mouse cursor (Coordinates relative to top left corner of window) | None |
| wm_rbuttondown | Sent when right mouse button is pressed | One of the following: MK_MBUTTON (middle button down) MK_LBUTTON (left button down) MK_SHIFT (Shift key down) MK_ONTROL (Control key down) | LO=x coordinate of mouse cursor HO=y coordinate of mouse cursor (Coordinates relative to top left corner of window) | None |
| VM_RBUTTONUP | Sent when right mouse button is released | One of the following: MK_MBUTTON (middle button down) MK_LBUTTON (left button down) MK_SHIFT (Shift key down) MK_CONTROL (Control key down) | LO=x coordinate of mouse cursor HO=y coordinate of mouse cursor (Coordinates relative to top left corner of window) | None |
| VM_SETCURSOR* | Occurs if mouse input not captured and mouse moves | Handle to window containing cursor | LO=hit-test area code HO=mouse message number | None |
| /M_TIMER | Sent when time limit for timer is elapsed | Timer ID | Lp to function passed to SetTimer | None |
| WM_VKEYTOITEM* | Sent by list box in response to WM KEYDOWN | Virtual-key code user pressed | LO=window handle of list box HO=current caret position | Action† |
| VM_VSCROLL | Sent when user clicks mouse in vert scroll bar | One of following scroll-bar codes: SB_LINEDV (scroll up one line) SB_LINEDOWN (scroll down one line) SB_PAGEUP (scroll up one page) SB_PAGEUP(with (scroll down one page) SB_THUMBPOSITION (to position) SB_THUMBPTACK (thumb dragged) SB_TOP (scroll to lop) SB_BOTTOM (scroll to bottom) SB_ENDS_CROLL (end of scroll) | If sent by scroll-bar control, HO=handle of control | None |

*Applies to all versions of Windows beginning with 3.0. †Action defined as one of following:

= -2, application handled selection, no further action needed.

= -1, list box should perform default action.

= 0 or larger, index of list box item on which default action for keystroke should be made

vKey information coded as follows:

| Bits and Meaning | Allowable Values |
|------------------------------|-----------------------|
| Bit 31 = transition state | 1=released, 0=pressed |
| Bit 30 = previous key state | 1=down, 0=up |
| Bit 29 = context code | 1=Alt down, 0=Alt up |
| Bits 27-28 = used by Windows | |
| Bits 25-26 = not used | |
| Bit 24 = extended key status | 1=extended key, 0=no |
| Bits 16-23 = scan code | OEM dependent value |
| Bits 0-15 = repeat count | |

| Message Name | Purpose | wParam | IParam |
|--------------------|--|---------------------------------|--|
| WM_COMPACTING* | Sent to top-level windows if >12.5% time spent performing memory compaction | Ratio of CPU time compacting | Not used |
| WM_DEVMODECHANGE | Sent to top-level windows when device mode settings change | Not used | Long pointer to WIN.INI device name |
| WM_FONTCHANGE | Sent to top-level windows when pool of font resources changes | Not used | Not used |
| WM PALETTECHANGED* | Informs all windows that system palette is changed | Handle of window causing change | Not used |
| WM_SPOOLERSTATUS* | Sent whenever Print Manager adds or removes a job in queue | SP_JOBSTATUS | LO=number of jobs remaining; HO=not used |
| WM_SYSCHAR | Sent when WM_SYSKEYUP or WM_SYSKEYDOWN translated | ASCII-code of System-menu key | Key info† |
| WM_SYSCOLORCHANGE | Sent to top-level windows when system color setting changes | Not used | Not used |
| WM_SYSCOMMAND | Sent when user selects command from System menu or when user selects maximize or minimize box | Type of system command | If mouse used, LO=x-coordinate, HO=y-coordinate; otherwise not used |
| WM_SYSDEADCHAR | Sent when WM_SYSKEYUP or WM_SYSKEYDOWN translated | Dead-key character value | LO=repeat count, HO=auto repeat count |
| WM SYSKEYDOWN | Sent when user holds down Alt key and another key | Virtual-key code | Key info† |
| WM SYSKEYUP | Sent when user releases Alt key and another key | Virtual-key code | Key info† |
| WM_SYSTEMERROR: | Sent to top-level windows when out-of-memory error occurs | 8=out of memory error code | Not used |
| WM_TIMECHANGE | Sent to top-level windows when application changes system time | Not used | Not used |
| WM_WININICHANGE | Sent to top-level windows when WIN.INI is changed | Not used | Long pointer to string specifying section that changed; 0 if more than one change |

^{*}Applies to all versions of Windows beginning with 3.0. †Key information coded as follows:

| Bits and Meaning | Allowable Values | |
|---|-----------------------|--|
| Bit 31 = transition state | 1=released, 0=pressed | |
| Bit 30 = previous key state | 1=down, 0=up | |
| Bit 29 = context code | 1=Alt down, 0=Alt up | |
| Bits 27-28 = used internally by Windows | | |
| Bits 25-26 = not used | | |
| Bit 24 = extended key status | 1=extended key, 0=no | |
| Bits 16-23 = scan code | OEM dependent value | |
| Bits 0-15 = repeat count | | |

| CB_GETCURSEL† | Returns currently selected item | Not used | Not used | Index of item or CB_ERR |
| CB_GETEDITSEL† | Returns position of selected text | Not used | Not used | Position¥ |
| CB_GETITEMDATA† | Retrieves application-supplied value | Index to item | Not used | 32-bit value or CB_ERR |
| CB_GETLBTEXT† | Copies string from list box to buffer | Index to string | Lp to buffer | Length in bytes or CB_ERR |
| CB_GETLBTEXTLEN† | Returns length of string in list box | Index of string | Not used | Length in bytes or CB_ERR |
| CB_INSERTSTRING† | Inserts string into list box | Index to string position or -1 | Lp to ASCIIZ string to insert | Index of string or error |
| CB_LIMITTEXT† | Limits length of text user may enter | Max number of bytes | Not used | TRUE=success |
| CB_RESETCONTENT† | Removes all strings from list box | Not used | Not used | None |
| CB_SELECTSTRING† | Selects first matching string | Index of item before search start or -1 | Lp to ASCIIZ prefix string | Index of match or CB_ERR |
| CB_SETCURSEL† | Selects string and scrolls into view | Index of string or -1 | Not used | May be CB_ERR |
| CB_SETEDITSEL† | Selects chars in edit control | Not used | LO=start position HO=end position | TRUE=success or error |
| CB_SETITEMDATA† | Sets value for item | Index of item | New value for item | May be CB_ERR |
| CB_SHOWDROPDOWN† | Shows or hides drop-down list box | TRUE=display if not visible FALSE=hide if visible | Not used | None |
| DM_GETDEFID | Retrieves ID of default push-button control for dialog box | Not used | Not used | LO=ID HO=DC_HASDEFID or NULL |
| DM_SETDEFID | Sets default push-button control for dialog box | ID of new default control | Not used | None |
| EM_CANUNDO | Sent to determine if edit control can undo last edit | Not used | Not used | Nonzero if control accepts EM_UNDO |
| EM_EMPTYUNDOBUFFER† | Directs control to empty undo buffer | Not used | Not used | None |
| EM_FMTLINES | Sent to add or remove EOL char from text lines | 0=remove EOL Nonzero=add CR CR LF to lines | Not used | Nonzero if any formatting occurs |
| EM_GETHANDLE | Sent to determine handle of buffer holding control window contents | Not used | Not used | Data handle of edit control buffer |
| EM_GETLINE | Sent to copy a line from the edit control | Line number | Far pointer to buffer to store line (first word=max length allowed) | Number of bytes copied |
| EM_GETLINECOUNT | Sent to determine number of lines of text in edit control | Not used | Not used | Number of lines in control |
| M_GETMODIFY | Returns current value of modify flag | Not used | Not used | Modify flag |

6.089. CONTROL MESSAGES (continued)

| Message Name EM GETRECT | Purpose Sent to determine formatting | wParam Not used | IParam PEOT | Return |
|-------------------------|---|---|---|---|
| | rectangle of control | | Long pointer to RECT | None |
| EM_GETSEL | Sent to determine start and end positions of selection | Not used | Not used | LO=start position HO=first non-select |
| EM_LIMITTEXT | Sent to limit length of text the user may enter | Maximum bytes | Not used | None |
| EM_LINEFROMCHAR* | Sent to determine which line contains a specific character | Index to character or -1 | Not used | Line number |
| EM_LINEINDEX | Sent to determine number of char positions before first char on line | Line number or -1 for current line | Not used | Char positions that precede first char |
| EM_LINELENGTH | Sent to determine length of line in edit control's text buffer | Line number or -1 for current line | Not used | Line length |
| EM_LINESCROLL | Sent to scroll context of control by a number of lines | Not used | LO=number of vert. lines HO=number of horiz. char positions | None |
| EM_REPLACESEL | Sent to replace selection with new text | Not used | Far pointer to ASCIIZ string of replacement text | None |
| EM_SCROLL¶ | Sent to direct edit control to scroll window vertically | One of the following values: SB_UNEUP SB_UNEDOWN SB_PAGEUP SB_PAGEUN SB_PAGEDOWN SB_THUMBPOSITION EM_GETTHUMB | Not used | None |
| EM_SETFONT1 | Sent to set edit control font being used | Font ID (must be fixed pitch) | Not used | None |
| EM_SETHANDLE | Sent to establish text buffer used to hold control window contents | Handle to buffer in application's data segment | Not used | None |
| M SETMODIFY | Sets modify flag for control | New modify flag value | Not used | None |
| M_SETPASSWORDCHART | Sets char displayed in control created with ES_PASSWORD | Char to display or NULL | Not used | None |
| EM_SETRECT | Sent to set formatting rectangle of control | Not used | Lp to RECT specifying new rectangle | None |
| EM_SETRECTNP | Sent to set formatting rect of control with no repainting | Not used | Lp to RECT specifying new rectangle | None |
| EM_SETSEL | Sent to select chars between start and end position | Not used | LO=start position HO=ending position | None |
| M_SETTABSTOPS† | Sets tab stop positions for multiline control | Number of tabs | Lp to array of integers describing tab stops | TRUE=all tabs set |
| M_SETWORDBREAK* | Sent to set word break for multiline edit controls | Not used | Lp to application-supplied word break function | None |
| M UNDO | Sent to undo last edit to edit control | Not used | Not used | Nonzero=success |
| B ADDSTRING | Sent to add string to list box | Not used | Lp to ASCIIZ string to add | Index to string or error |
| B_DELETESTRING | Sent to delete string from list box | Index to string to delete | Not used | Strings remaining or error |
| B_DIR | Sent to add list of files in current directory to list box | DOS attribute value | Lp to file specification string (may include * and ?) | Item count or error |
| B FINDSTRING† | Finds first string matching prefix | Index of item preceding start | Pointer to ASCIIZ string | Index of match or emo |
| B_GETCOUNT | Sent to get count of number of items in list box | Not used | Not used | item count or error |
| B_GETCURSEL | Sent to return index of current selection, if any | Not used | Not used | Index of selection or error |
| B GETHORIZONTALEXTENT† | Retrieves width in pixels box can scroll | Not used | Not used | Width, in pixels |
| B_GETITEMDATA† | Retrieves value associated with item | Index to item | Not used | 32-bit value |
| B_GETITEMRECT† | Retrieves rectangle bounding item | Index to item | Lp to RECT | May be LB_ERR |
| B_GETSEL | Sent to return selection state of an item | Index to the item | Not used | >0 if item selected or 0 or LB_ERR |
| B GETSELCOUNT† | Returns number of selected items | Not used | Not used | Item count, LB_ERR |
| B_GETSELITEMS† | | Max number of selected items | Lp to buffer | May be LB_ERR or number of items |
| B_GETTEXT | Sent to copy string from list into buffer | Index to string to copy into buffer | Lp of buffer to receive string copy | Length of string in bytes or error |
| B_GETTEXTLEN | Sent to determine length of string in list box | Index to the string | Not used | Length of string in bytes or error |
| B GETTOPINDEX† | Returns index of first visible item | Not used | Not used | Index of item |
| B_INSERTSTRING | Sent to insert string into list box | Index to position for string, or -1 for end of list | Lp to ASCIIZ string to insert | Index of insertion or error |
| B_RESETCONTENT | Sent to remove all strings from box | Not used | Not used | None |

6.089. CONTROL MESSAGES (continued)

| Message Name | Purpose | wParam | IParam | Return |
|-------------------------|--|---|---------------------------------------|-------------------------------------|
| LB_SELECTSTRING | Sent to change selection to first string matching prefix | Index of start point for search, -1=search all strings | Lp to ASCIIZ prefix string | Index of selected item or LB ERR |
| LB_SELITEMRANGE† | Selects one or more items | O=deselect, nonzero=select | LO=index of first HO=index of last | May be LB_ERR |
| LB SETCOLUMNWIDTH† | Sets width in pixels of all columns | Width, in pixels | Not used | None |
| LB_SETCURSEL | Sent to select string and scroll it into view, if necessary | Index to string to select or -1 | | May be LB_ERR |
| LB_SETHORIZONTALEXTENT† | Sets width list box can be scrolled | Pixels list box can scroll horz. | Not used | None |
| LB SETITEMDATA† | Sets value associated with item | Index to item | New value of item | May be LB_ERR |
| LB_SETSEL | Sent to set selection state of a string | 0=unhighlight; ≠0=highlight | LO=index to string or -1 for all | May be LB_ERR |
| LB_SETTABSTOPS† | Sets tab stop positions in list box | Number of tab stops | Lp to integer array of tab positions | TRUE=all tabs set |
| LB SETTOPINDEX† | Sets first visible item in list box | Index of item | Not used | May be LB ERR |
| WM CLEAR | Sent to delete current selection | Not used | Not used | Not used |
| WM_COMPAREITEM† | Determines relative position of item | Not used | Lp to COMPAREITEMSTRUCT | Value§ |
| WM_COPY | Sent to copy current selection to clipboard in CF_TEXT format | Not used | Not used | None |
| WM_CUT | Sent to perform WM_COPY and WM_CLEAR, in that order | Not used | Not used | None |
| WM DELETEITEM† | Indicates list box item was removed | Not used | Lp to DELETEITEMSTRUCT | None |
| WM DRAWITEM† | Sent when visual aspect changed | Not used | Lp to DRAWITEMSTRUCT | None |
| WM GETFONT† | Gets current control's font | Not used | Not used | Font handle or NULL |
| WM_PASTE | Sent to copy clipboard data to current window at current cursor pos | Not used | Not used | None |
| WM MEASUREITEM† | Sent when control is created | Not used | Lp to MEASUREITEMSTRUCT | None |
| WM NEXTDLGCTL | Sent to alter control focus | Control receiving focus | Control flag | None |
| WM SETFONT† | Specifies font to draw text in | Font handle or NULL (default) | TRUE=redraw itself | None |
| WM UNDO | Undoes last operation | Not used | Not used | None |

*Applies to all versions of Windows beginning with version 2.0. †Applies to all versions of Windows beginning with version 3.0.

No longer documented beginning with Windows 3.0 *LO word=start position, HO word=end position

§-1=item 1 sorts before item 2 0=item 1 and 2 sort the same 1=item 1 sorts after item 2

| AddAtom | ATOM | lpstring | LPSTR | Points to char string to add to table | ATOM or NULL | 2 |
| AddFontResource | Int | lpFilename | LPSTR | Points to char string containing font res file | Number of fonts | 3 |
| | | | | or contains handle to loaded module | added or 0 | - |
| AdjustWindowRect | vold | IpRect | LPRECT | Points to RECT structure of client rectangle | None | 3 |
| | l l | dwStyle bMenu | DWORD | Specifies window styles | 1 | |
| AdjustWindowRectExt | void | lpRect | BOOL LPRECT | Specifies whether window has menu | | |
| AdjustWindowHectExT | Void | dwStyle | DWORD | Points to RECT of client rectangle | None | 4 |
| | 1 | bMenu | BOOL | Specifies window styles of window to convert | | |
| | ı | dwExStyle | DWORD | Specifies whether window has a menu | | |
| AllocDStoCSAlias† | WORD | wSelector | WORD | Specifies extended style of window | CS selector or | |
| Allocodiocodiasi | 1 | 11100100101 | "" | Specifies data-segment selector | Offerror | 5 |
| AllocResource | HANDLE | hinstance | HANDLE | ID of module containing resource | Global memory | 5 |
| | | hResinfo | HANDLE | ID of resource | block allocated | , |
| | ı | dwSize | DWORD | Specifies override size in bytes (0=ignore) | for resource | |
| AllocSelector† | WORD | wSelector | WORD | Specifies selector to be copied or NULL | Selector, or 0 | 6 |
| · | | | l | If new, uninitialized sector desired | If error | |
| AnimatePalette† | vold | hPalette | HPALETTE | ID of logical palette | None | 7 |
| | 1 | wStartIndex | WORD | First entry of palette to be animated | ' | |
| | 1 | wNumEntries | WORD | Number of entries to be animated | | 1 |
| | 1 | lpPaletteColors | LPPALETTEENTRY | Points to first entry of replacement structs | | l |
| AnsiLower | LPSTR | lpString | LPSTR | Points to ASCIIZ string, or if HO=0 then | Ptr to converted | 7 |
| | 1 | | | LO byte contains character | string, or char in LO | |
| AnsiLowerBuff† | WORD | lpString | LPSTR | Points to buffer containing 1 or more chars | Length of converted | 8 |
| | | nLength | WORD | Number of chars in buffer (0=65,536) | string | |
| AnsiNext | LPSTR | lpCurrentChar | LPSTR | Points to char in ASCIIZ string | Next char in string | 8 |
| AnsiPrev | LPSTR | lpStart | LPSTR | Points to beginning of string | Prev char in string | 9 |
| | | IpCurrentChar | LPSTR | Points to char in ASCIIZ string | | |
| AnsiToOem | int | lpAnsiStr | LPSTR | Points to ASCIIZ string (in ANSI set) | Always -1 | 9 |
| | | lpOemStr | LPSTR | Points to location to put translated string | | ـــــ |
| AnsiToOemBuff† | void | lpAnsiStr | LPSTR | Points to buffer containing ANSI chars | None | 10 |
| | 1 | IpOemStr | LPSTR | Points to location to put translated string | | l |
| | | nLength | WORD | Number of chars in buffer (0=65,536) | | Ь. |
| AnsiUpper | LPSTR | lpString | LPSTR | Points to ASCIIZ string, or if HO=0 then | Ptr to converted | 10 |
| | | | | LO byte contains character | string, or char in LO | ١., |
| AnsiUpperBuff† | WORD | lpString | LPSTR | Points to buffer containing ANSI chars | Length of converted | 11 |
| | 1 | nLength | WORD | Number of chars in buffer (0=65,536) | string | ١., |
| AnyPopup | BOOL | none | | | ≠0=popup exists TRUE=success | 11 |
| AppendMenu† | BOOL | hMenu | HMENU WORD | ID of menu to change Specifies state of new menu item to add | THUE=SUCCESS | Ι" |
| | 1 | wFlags | WORD | | 1 | 1 |
| | 1 | wiDNewitem | | Command ID of new item, or menu handle of popup | | ı |
| | | lpNewItem | LPSTR | Content of new menu item | A 9 d | 14 |
| Arc | BOOL | hDC | HDC | ID of device context | ≠0 if arc drawn | 1 '' |
| | 1 | X1 | int | x-coord of upper-left corner of bounding rect | | 1 |
| | | Y1 | int | y-coord of upper-left corner of bounding rect | 1 | 1 |
| | | X2 | int | x-coord of lower-right corner of bounding rect | 1 | 1 |
| | | Y2 | int | y-coord of lower-right corner of bounding rect | | 1 |
| | | X3 | int | x-coord of arc's start point | | 1 |
| | 1 | Y3 | int | y-coord of arc's start point | | 1 |
| | | X4 | int | x-coord of arc's end point | | 1 |
| | | Y4 | int | y-coord of arc's end point | Height of ignor of A | ٠, |
| ArrangelconicWindows† | WORD | hWnd | HWND | ID of window | Height of icons or 0 | 19 |
| BeginDeferWindowPost | HANDLE | nNumWindows | int | Number of windows | or NULL | Ι' |
| BeginPaint | HDC | hWnd | HWND | ID of window | DC of window | 1 |
| oeginraint | HDC | | ILPPAINTSTRUCT | Data structure to receive painting Info | OU MINOU | 1 |
| BitBit | DOC: | IpPaint | | ID of device context to receive bitmap | ≠0 if bitmap drawn | 1 |
| DILDIL | BOOL | hDestDC | HDC | x-coord of upper-left corner of dest rect | - C. Coloniap Gardin | l İ |
| | 1 | IĈ. | int | y-coord of upper-left corner of dest rect | | 1 |
| | 1 | Lucan | int | Width of bitmap in logical units | | 1 |
| | 1 | nWidth | int | Height of bitmap in logical units | | 1 |
| | 1 | nHeight | int | ID of device context to receive bitmap | | 1 |
| | 1 | hSrcDC | HDC | x-coord of upper-left corner of source bitmap | | 1 |
| | 1 | XSrc | lnt | x-coord or upper-ien corner of source bitmap | | 1 |
| | ı | YSrc | int | y-coord of upper-left corner of source bitmap | | 1 |
| | | dwRop | DWORD | Raster operation to perform | None | 1 2 |
| 3ringWindowToTop | void | hWnd | HWND | ID of window to bring to top | 0 if success | + 2 |
| BuildCommDCB | int | lpDef | LPSTR | Points to ASCIIZ string with device-control info | <0 if error | ľ |
| | 1 | IpDCB | DCB FAR * | Points to DCB structure to receive string | <0 if error FALSE=message | 1 2 |
| | BOOL | IpMsq | LPMSG | Points to MSG structure to be filtered | L-vr-2F=wessage | |
| CallMsgFilter | IDOOL | nCode | lnt | Code used by filter function to process message | should be processed | |

| Function Name | Туре | Parameters* | Рат Туре | Parameter Definition | Return Value | Pg§ |
|-----------------------|-------------|---------------------------|--------------------------|---|--|------|
| CallWindowProc | LONG | lpPrevWndFunc | FARPROC | Address of previous window function | Depends upon | 22 |
| | 1 | hWnd | HWND | ID of window receiving message | message sent | |
| | I. | wMsg | WORD | Message number | | ĺ |
| | 1 | wParam | WORD | Message-dependent information | | |
| | | IParam | DWORD | Message-dependent Information | | |
| Catch | int | lpCatchBuf | LPCATCHBUF | Points to CATCHBUF structure | 0=environment copied to buffer | 22 |
| ChangeCllpboardChain | BOOL | hWnd hWndNext | HWND HWND | ID of window to be removed from chain ID of window following hWnd in chain | ≠0 if window found and removed | 23 |
| ChangeMenu | No longer : | supported by 3.0 (replace | ed by AppendMenu, Delete | Menu, InsertMenu, ModifyMenu, and RemoveMenu) Selector to receives the converted selector | | 23 |
| Change Selector† | WORD | wDestSelector | WORD | Selector to receives the converted selector | Selector copied | 24 |
| | | wSourceSelector | WORD | Selector to be converted | and converted 0 if fallure | |
| CheckDlgButton | void | hDig | HWND | ID of dialog box containing button | none | 24 |
| | | nIDButton | Int | Button control to be modified | | l |
| | | wCheck | WORD | Action to take | | l |
| CheckMenultem | BOOL | hMenu | HMENU | ID of menu | Previous state of | 25 |
| | 1 | wIDCheckItem | WORD | Menu Item to be checked | Item or -1 if menu | ì |
| | 1 | wCheck | WORD | Method to check menu item | Item doesn't exist | ı |
| CheckRadioButton | void | hDlg | HWND | ID of dialog box | None | 26 |
| | 1 | nIDFirstButton | Int | Integer ID of first radio button in group | | |
| | ı | nIDLastButton | Int | Integer ID of last radio button in group | 1 | ı |
| | 1 | nIDCheckButton | int | Integer ID of radio button to be checked | | ı |
| ChildWindowFromPoint | HWND | hWndParent | HWND | ID of parent window | ID of child window | 26 |
| | | Point | POINT | Client coordinates of point to be tested | containing point or | 20 |
| Chord | BOOL | hDC | HDC | ID of device context chord to appear in | ≠0 if arc drawn | 27 |
| | I SOOL | X1 | lint | x-coord of bounding rects upper-left corner | - u alcuawii | ا '' |
| | 1 | Ŷi | int | y-coord of bounding rects upper-left corner | | 1 |
| | 1 | X2 | | y-coord of bounding recis upper-left corner | | ł |
| | 1 | Y2 | int | x-coord of bounding rects lower-right corner | 1 | ı |
| | | | int | y-coord of bounding rects lower-right corner | 1 | ı |
| | 1 | X3 | int | x-coord of one end of line segment | ļ | ı |
| | | Y3 | int | y-coord of one end of line segment | | 1 |
| | 1 | X4 | int | x-coord of one end of line segment | | Į. |
| | | Y4 | int | y-coord of one end of line segment | | |
| ClearCommBreak | int | nCid | int | Communication device to be restored | 0=success <0 if invalid device | 26 |
| ClientToScreen | void | hWnd lpPoint | HWND LPPOINT | ID of window whose client area will be used for conv. Points to POINT structure with coords to convert | None | 26 |
| ClipCursor | void | IpRect | LPRECT | Points to RECT structure with confining rectangle | None | 25 |
| CloseClipboard | BOOL | · | i e | | ≠0 dipboard closed | 25 |
| CloseComm | int | nCid | lint | Communication device to be closed | 0=success | 30 |
| CloseMetaFile | HANDLE | hDC | HANDLE | ID of metafile DC to close | ≠0 file closed else NULL | 30 |
| CloseSound | void | | | | None | 30 |
| CloseWindow | void | hWnd | HWND | ID of window to minimize | None | 30 |
| CombineRgn | int | hDestRgn hSrcRgn1 | HRGN HRGN | ID of existing region to be replaced ID of first region to combine | Type of resulting region | 31 |
| | | hSrcRgn2 | HRGN | ID of second region to combine | 1 *** | 1 |
| | 1 | nCombineMode | int | Type of operation to perform on regions | 1 | 1 |
| opyMetaFile | HANDLE | hSrcMetaFile | HANDLE | ID of source metafile | ID of new metafile | 3 |
| opportat no | 1.201016 | IpFilename | LPSTR | Points to ASCIIZ string of file to recieve metafile | I S I NOW INCOME | ı۰ |
| CopyRect | int | IpDestRect | LPRECT | Points to ASCIIZ string of the to receive metallie | Not used (has no | 32 |
| | 1 | IpSourceRect | LPRECT | Points to source RECT data structure | meaning) | 3 |
| CountClipboardFormats | int | -1/-1 | | Maria and the second of | Number of formats | 1 % |
| CountVoiceNotes | int | nVoice | int | Voice queue to be counted | Number of notes | 3 |
| reateBitmap | HBITMAP | nWidth | int | Width of bitmap in pixels | ID of bitmap if | 3 |
| | 1 | nHeight | int | Height of bitmap in pixels | successful, or NULL | 1 |
| | 1 | nPlanes | BYTE | Number of color planes in bitmap | I | 1 |
| | 1 | nBitCount | BYTE | Number of color bits per display | | ı |
| | I | lpBits | LPSTR | Points to array of initial bitmap bit values | L | 丄 |
| reateBitmapIndirect | HBITMAP | lpBitmap | BITMAP FAR * | Points to BITMAP struct | ID of bitmap if successful, or NULL | 3 |
| reateBrushIndirect | HBRUSH | lpLogBrush | LOGBRUSH FAR * | Points to LOGBRUSH struct | ID of logbrush if successful, or NULL | 3 |
| 'resteCaret | void | hWnd | HWND | ID of window owning caret | None None | 3 |
| createCaret | void | | חאאוט | ID of window owning caret | luone. | 1 3 |
| | | hBitmap | HBITMAP | ID of bitmap defining shape | 1 | 1 |
| | | nWidth | int | Width of caret in logical units | 1 | 1 |
| | | nHeight | int | Height of caret in logical units | | Ļ |
| reateCompatibleBitmap | HBITMAP | hDC | HDC | ID of device context | ID of bitmap If | 3 |
| | 1 | nWidth | int | Width of bitmap in bits | successful, or NULL | 1 |
| | | nHeight | int | Height of bitmap in bits | 1 | |

| Function Name | Туре | Parameters* | Parm Type | Parameter Definition | Return Value | Pot |
|--|------------|------------------|---------------|---|----------------------|------|

| GetGValue | BYTE | rgbColor | DWORD | Color specification | Green value of color | 17 |
| SetInputState | BOOL | 1 | 1 | | Input state or 0 | 17 |
| SetInstanceData | int | hinstance | HANDLE | ID of previous call of application | Number of bytes | 17 |
| Jonnoto Data | l | pData | NPSTR | Pointer to buffer in current instance | actually copied | 1 |
| | | nCount | int | Number of bytes to copy | 40.04., 00, | 1 |
| GetKBCodePage† | int | IICOUIL | int. | Number of bytes to copy | Code page | 17 |
| | | 1.1/. 0 | DVCE 540.4 | Deliver to 000 bits by the advistment have and as | None | 18 |
| SetKeyboardState | void | lpKeyState | BYTE FAR * | Pointer to 256-byte buffer of virtual-key codes | | 18 |
| etKeyboardType† | int | nTypeFlag | int | Type or subtype flag | Type or subtype | 18 |
| GetKeyNameText† | int | IParam | DWORD | 32-bit parameter of keyboard message | Actual length of | 18 |
| | 1 | lpBuffer | LPSTR | Buffer to receive key name | string copied | |
| | | nSize | WORD | Maximum length of name int bytes | | \bot |
| SetKeyState | int | nVirtKey | int | Virtual key | State of key | 18 |
| etLastActivePopup† | HWND | hwndOwner | HWND | ID of owner window | ID of most recent popup | 18 |
| Cathlanklada | - | 100 | UDC | ID of decise context | Mapping mode | 18 |
| etMapMode | int | hDC | HDC | ID of device context | ID of menu or NULL | 18 |
| etMenu | HMENU | hWnd | HWND | ID of window with menu to examine | LO=width | 18 |
| SetMenuCheckMark | DWORD | | | | HO=helaht | ۱'° |
| Dimensionst | 1 | ļ | | | Number of items | 18 |
| SetMenuItemCount | WORD | hMenu | HMENU | ID of menu handle to examine | In menu or -1 | L |
| SetMenultemID | WORD | hMenu | HMENU | ID of handle to popup menu containing item | Item ID or -1 | 18 |
| | 1 | nPos | int | Position of menu item to retreive ID for | | _ |
| | | | | | | 18 |
| | WORD | | | ID of menu | Doesn't exist=-1 | 1 '0 |
| ietMenuState | WORD | hMenu wID | HMENU WORD | ID of menu Menu item ID | Doesn't exist=-1 or mask of values | '" |

| Function Name | Туре | Parameters* | Parm Type | Parameter Definition | Return Value | Pg§ |
|--------------------------|---------|------------------------|--|--|--------------------------------|-----|
| GetMenuString | int | hMenu | HMENU | ID of menu | Actual bytes copied | 187 |
| | | wlDitem | WORD | Menu Item ID | to buffer | |
| | | IpString | LPSTR | Pointer to buffer to receive label | 1 1 | |
| | 1 | nMaxCount | int | Meximum length of label | | |
| | BOOL | wFlag | WORD LPMSG | Nature of wID parameter Pointer to MSG struct | l | |
| GetMessage | BOOL | lpMsg hWnd | HWND | | ≠0 if message other | 184 |
| | 1 | wMsgFilterMin | WORD | ID of window or NULL | than WM_QUIT, | |
| | 1 | wMsgFilterMax | WORD | Integer value of lowest message value to retrieve | or 0 | |
| | | www.sgrinermax | WORD | Integer value of highest message value to retrieve | i | |
| GetMessagePos | DWORD | | | | LO=x-coord HO=y-coord | 189 |
| GetMessageTime | DWORD | | | | Message time | 189 |
| GetMetaFile | HANDLE | IpFilename | LPSTR | Pointer to ASCIIZ string of DOS metafile name | Metafile ID or NULL | 190 |
| GetMetaFileBits | HANDLE | hMF | HANDLE | ID of metafile in memory | Memory block that | 19 |
| | | | | , | contains metafile or NULL | ٠. |
| GetModuleFileName | int | hModule | HANDLE | ID of module | Actual length of | 190 |
| | l | lpFilename | LPSTR | Pointer to buffer to receive filename | string copied | ٠ |
| | 1 | nSize | int | Maximum size of buffer | 339 30,000 | |
| GetModuleHandle | HANDLE | lpModuleName | LPSTR | Pointer to ASCIIZ string specifying module | ID of module or NULL | 191 |
| GetModuleUsage | int | hModule | HANDLE | ID of module | Reference count of | 191 |
| <u>-</u> | 1 | | | | module | L |
| GetNearestColor | DWORD | hDC | HDC | ID of device context | RGB value | 192 |
| | - | crColor | COLORREF | Color to be matched | | |
| GetNearestPaletteIndex† | WORD | hPalette | HPALETTE | ID of logical palette | Index to palette | 193 |
| | | crColor . | COLORREF | Color to be matched | | |
| GetNextDlgGroupItem | HWND | hDlg | HWND | ID of dialog box to search | Next or previous | 19 |
| | 1 | hCtl | HWND | ID of control in dialog box to start search | control in group | |
| | | bPrevious | BOOL | How function is to search dialog box | | L_ |
| GetNextDlgTabItem | HWND | hDlg | HWND | ID of dialog box to search | Next or previous | 19 |
| | i | hCti | HWND | ID of control in dialog box to start search | control having | 1 |
| | | bPrevious | BOOL | How function is to search dialog box | tab style | _ |
| GetNextWindow | HWND | hWnd | HWND | ID of current window | Next or previous | 19 |
| | | wFlag | WORD | Handle of next or previous window flag | window | _ |
| GetNumTasks | int | | 1 | | Number of tasks | 19 |
| GetObject | int | hObject | HANDLE | ID of object | Actual number of | 19 |
| | | nCount | int | Number of bytes to copy to buffer | bytes retrieved or | l |
| | 1 | lpObject | LPSTR | Pointer to buffer to receive data | 0 | ᆫ |
| GetPaletteEntries† | WORD | hPalette | HPALETTE | ID of logical palette | Number of entries | 19 |
| | | wStartIndex | WORD | First entry in palette to retrieve | retrieved, or 0 | l |
| | | wNumEntries | WORD | Number of entries to retrieve | | l |
| | 1 | lpPaletteEntries | LPPALETTEENTRY | Pointer to array of structs to receive entries | | L_ |
| GetParent | HWND | hWnd | HWND | ID of window to retrieve parent window ID for | ID of parent window or NULL | 19 |
| GetPixel | DWORD | hDC | HDC | ID of device context | RGB color or -1 | 19 |
| Jeli ixei | PHONE | IX | int | x-coord of point to examine | If not in dip region | ۱' |
| | | IÇ | Int | y-coord of point to examine | II not in dip region | 1 |
| GetPolyFillMode | int | hDC | HDC | ID of device context | Polygon filling mode | 19 |
| GetPriorityClipboard | int | IpPriorityList | WORD FAR * | Pointer to array of dipboard formats | Highest clipboard | 19 |
| Formatt | j"" | nCount | int | Number of dipboard formats in list | format, NULL, or | " |
| GetPrivateProfileInt† | WORD | IpApplicationName | LPSTR | Pointer to name of application | 0 if value not int or | 19 |
| Detr franci romenti | 1 | lpKevName | LPSTR | Pointer to key name | negative, or numeric | l |
| | i . | nDefault | int | Default value for given key if not in file | value | |
| | 1 | lpFileName | LPSTR | Pointer to string naming initialization file | | |
| GetPrivateProfileString† | int | IpApplicationName | LPSTR | Pointer to name of application | Number of chars | 19 |
| | I | lpKeyName | LPSTR | Pointer to key name | copied or NULL | Ľ |
| | 1 | IpDefault | LPSTR | Default value for key if not in file | | ı |
| | 1 | IpReturnedString | LPSTR | Pointer to buffer to receive char string | 1 | ı |
| | 1 | InSize | int | Maximum number of characters in buffer | 1 | ı |
| | 1 | IpFileName | LPSTR | Pointer to string naming Initialization file | 1 | ı |
| GetProcAddress | FARPROC | hModule | HANDLE | ID of library module containing function | Pointer to entry | 20 |
| Dell'IOCAGGESS | FARPHOC | Inmodule IpProcName | LPSTR | Pointer to function name or ordinal value of function | point, or NULL | ١., |
| Pat Deaffelat | WORD | | LPSTR | Pointer to function name or ordinal value of function Pointer to application name | 0 if value not int or | 20 |
| GetProfileInt | WORD | IpAppName | | | negative, or numeric | ۱۳ |
| | 1 | lpKeyName | LPSTR | Pointer to key name | value | ı |
| | 1 | nDefault | lint | Default value for key if not found in file | I ANDA | _ |

6.096. WINDOWS FUNCTION SUMMARY BY NAME (continued)

| Function Name | Type BOOL | Parameters* | Parm Type | Parameter Definition | Return Value | Pa6 |
|---------------------------------------|----------------|----------------------------|--|--|---|------------|
| LocalUnlock | BOOL | nmem | HANDLE | ID of local memory block | 0 if ref count is 0 | Pg§ 292 |
| LockData | HANDLE | Dummy | int | Not usedset to 0 | ID of locked data | 293 |
| LockResource | LPSTR | hResData | HANDLE | ID of resource | segment or NULL First byte of loaded resource | 293 |
| LockSegment | HANDLE | wSegment | WORD | Segment address of segment to lock | or NULL ID of segment or NULL | 294 |
| lopen | int | lpPathName iReadWrite | LPSTR Int | Pointer to ASCIIZ string naming file to open File access method | MS-DOS file handle or -1 | 295 |
| LOWORD | WORD | dwinteger | DWORD | Value to convert | LO word of value | 296 |
| LPtoDP | BOOL | hDC | HANDLE | ID of device context | ≠0 if all converted | 296 |
| | i | ipPoints nCount | LPPOINT | Pointer to array of pointers | ļ | 1 |
| food | int | hFile | int | Number of points in array | | |
| _lread | lut. | InButter | LPSTR | MS-DOS file handle to read Pointer to buffer to receive data | Number of bytes read or -1 | 297 |
| | | wBytes | WORD | Number of bytes to read from file | read or -1 | |
| Istrcat | LPSTR | lpString1 | LPSTR | Pointer to ASCIIZ string to add to | Pointer to IpString1 | 297 |
| | | lpString2 | LPSTR | Pointer to ASCIIZ string to append | or 0 | 1 237 |
| istrcmp† | int | lpString1 | LPSTR | Pointer to ASCIIZ string to compare | Less than, equal to. | 298 |
| | | lpString2 | LPSTR | Pointer to ASCIIZ string to compare | or greater than 0 | |
| Istrompi† | int | lpString1 | LPSTR | Pointer to ASCIIZ string to compare | Less than, equal to, | 299 |
| | int | ipString2 | LPSTR | Pointer to ASCIIZ string to compare | or greater than 0 | ┺. |
| Istropy | Int | lpString1 lpString2 | LPSTR | Pointer to ASCIIZ string to receive copy | Pointer to | 299 |
| Istrien | int | lpString2 | LPSTR | Pointer to ASCIIZ string to copy Pointer to ASCIIZ string | IpString1 or 0 Length of string | + |
| lwrite | int | hFile | int | MS-DOS file handle of file to write | Number of bytes | 300 |
| _iwine | | lpBuffer | LPSTR | Pointer to buffer of data to write | written, or -1 | 1 300 |
| | | wBytes | WORD | Number of bytes to write | Written, Gr-1 | |
| MAKEINTATOM | LPSTR | winteger | WORD | Numeric value of atom's string | Pointer to atom | 302 |
| | LPSTR | l | | | created | ٠ |
| MAKEINTRESOURCE MAKELONG | DWORD | nInteger wLow | int WORD | Integer value to convert | Pointer to string Unsigned long | 302 |
| MAKELUNG | DWOND | wHigh | WORD | LO word of new long value HO word of new long value | Unsigned long | 304 |
| MAKEPOINT | POINT | dwinteger | DWORD | x- and y-coords of point | POINT struct | 303 |
| MakeProcInstance | FARPROC | IpProc | FARPROC | Procedure-instance address | Pointer to function | 303 |
| | | hinstance | HANDLE | ID of instance associated with DS | or NULL | |
| MapDialogRect | void | hDig | HWND | ID of dialog box | None | 304 |
| | | IpRect | LPRECT | Pointer to RECT with coordinates to convert | | |
| MapVirtualKey† | WORD | wCode wMapType | WORD WORD | Virtual-key code or scan code for key Type of mapping to perform | Varies depending upon Input | 30 |
| max | int | value1 | int | First value | Greater of the | 30 |
| | l | value2 | int | Second value | two values | |
| MessageBeep | void | wType | WORD | Not usedset to 0 | None | 30 |
| MessageBox | int | hWndParent | HWND | ID of window owning message box | Menu-item value | 30 |
| | J | IpText | LPSTR | Pointer to ASCIIZ string with message to display | or 0 | 1 |
| | 1 | IpCaption | LPSTR | Pointer to ASCIIZ string with dialog-box caption | | |
| · · · · · · · · · · · · · · · · · · · | | wType value1 | WORD | Contents of dialog box First value | Lessor of the | 30 |
| min | int | value1 value2 | int int | Second value | two values | ~ |
| ModifyMenut | BOOL | hMenu | HMENU | ID of menu to change | TRUE if successful | 30 |
| modaywend (| I BOOK | nPosition | WORD | Menu item to change | 11102 11 000000 | 1 *** |
| | | wFlags | WORD | Interpretation of nPosition parameter | 1 | |
| | 1 | wiDNewitem | WORD | Command ID of menu item or menu handle of popup | | |
| | 1 | loNewItem | LPSTR | Content of changed menu item | | |
| MoveTo | DWORD | hDC | HDC | ID of device context | LO=old x-coord | 31: |
| | | x | Int | x-coord of new position | HO=old y-coord | |
| | | Υ | int | y-coord of new position | | 313 |
| MoveWindow | vold | hWnd | HWND | ID of popup or child window | None | 31. |
| | | Х | int | New x-coord of upper-left corner | | |
| | 1 | Υ | int | New y-coord of upper-left corner | 1 | - |
| | ı | nWidth | int | New width of window | 1 | 1 |
| | ı | nHeight | int | New height of window Whether window is repainted after moving | 1 | 1 |
| MulDivt | 1: | bRepaint nNumber | BOOL | Number to be multiplied by nNumerator | Result or 32,767 | 314 |
| IIIIIII I | int | nNumber nNumerator | int | Number to be multiplied by invariant | or -32767 if error | 1 |
| | ı | nNumerator nDenominator | Int | Number to divide result of nNumber*nNumerator by | | |
| NetBIOSCall† | Set all regist | ers as for an actual IN | | | None | 315 |
| DemKeyScant | DWORD | wOemChar | TWORD | ASCII value of OEM character | LO=OEM scan ID | 310 |
| | | | 1 | | HO=shift state | |

| Function Name | Туре | Parameters* | Parm Type | Parameter Definition | Return Value | Pg |
|--------------------|-------------|-----------------|---------------|---|-------------------|--------|

6.098. WINDOWS FUNCTION SUMMARY BY TYPE

| Function Name | Description | Туре |
|---|---|----------------------------------|
| LoadModulet | Loads and executes a Windows program | Application-execution |
| WinExect | Executes application | Application-execution |
| WinHelp† | Invokes Windows Help application | Application-execution |
| AddAtom DeleteAtom | Creates atom for character string lpString Deletes nAtom if its reference count is zero | Atom manager |
| FindAtom | Retrieves atom associated with IpString | Atom manager |
| GetAtomHandie | Returns handle of atom string | Atom manager |
| GetAtomName | Copies nSize chars of string of atom to lpBuffer | Atom manager Atom manager |
| GlobalAddAtom* | Adds global atom to the atom table | Atom manager |
| Global DeleteAtom* | Deletes global atom from the atom table | Atom manager |
| GlobalFindAtom ^e | Finds character string within atom table | Atom manager |
| GlobalGetAtomName | Returns copy of string associated with an atom | Atom manager |
| InitAtomTable | Initializes atom hash table | Atom manager |
| BuildCommDCB | Fills device control block with control codes | Communications |
| ClearCommBreak | Clears comm break state for nCid device | Communications |
| CloseComm | Closes comm device nCid (first transmits buffer) | Communications |
| EscapeCommFunction | Executes escape function nFunct for device nCid | Communications |
| FlushComm | Flushes characters from queue of device nCid | Communications |
| GetCommError | Fills lpStat buffer with status of nCid device | Communications |
| GetCommEventMask | Retrieves, then clears, the event mask for nCid | Communications |
| GetCommState | Fills IpDCB buffer with DCB of nCid device | Communications |
| OpenComm ReadComm | Opens device named by IpCommName for comm use Reads up to nSize bytes from nCid into IpBuf | Communications |
| SetCommBreak | Sets break state of device nCid and suspends transmission | Communications |
| SetCommEventMask | Sets event mask of device nCid and suspends transmission | Communications Communications |
| SetCommState | Sets device to state specified in IpDCB | Communications |
| TransmitCommChar | Places character cChar at head of transmit queue | Communications |
| JngetCommChar | Makes character cChar next character to be read from queue | Communications |
| VriteComm | Writes nSize bytes from buffer to device nCid | Communications |
| DebugBreakt | Forces a break to the debugger | Debugging |
| atalAppExitt | Displays message in IpMessageText and terminates app | Debugging |
| atalExit | Halts Windows and prompts through AUX | Debugging |
| Output Debug String† | Sends debugging message to debugger, if present | Debugging |
| /alidateCodeSegments† | Outputs debugging information to terminal if CS altered | Debugging |
| /alidateFreeSpaces | Checks free segments in memory for valid contents§ | Debugging |
| /alidateFreeSpaces* | Determines whether free segments contain valid contents | Debugging |
| GetDriveType† | Determines whether a disk drive is removeable, fixed, or remote | File I/O |
| GetSystemDirectory† | Returns pathname of Windows system subdirectory | File I/O |
| 3etTempDrive | Returns optimal drive letter for temp file | File I/O |
| SetTempFileName | Creates temporary file name | File I/O |
| SetWindowsDirectory† | Returns pathname of Windows directory | File I/O |
| DpenFile | Creates, opens, reopens, or deletes file named by IpFileName | File I/O |
| SetHandleCount† | Changes number of file handles available to task | File I/O |
| Iclose | Closes file specified by hFile | File I/O |
| Icreat | Opens a file with name specified by lpPathName | File I/O |
| liseek | Repositions pointer in previously opened file | File I/O |
| lopen | Opens file specified by IpPathName | File I/O |
| Iread | Reads data from file indentified by hFile | File I/O |
| lwrite | Writes data to file specified by hFile | File I/O |
| itBit | Moves bitmap from src device to dest device | GDI bitmap |
| reateBitmap | Creates bitmap of specified height, width, pattern | GDI bitmap |
| reateBitmapIndirect | Creates bitmap from existing bitmap | GDI bitmap |
| reateCompatibleBitmap | Creates bitmap compatible with device hDC | GDI bitmap GDI bitmap |
| reateDiscardableBitmap | Creates discardable bitmap | GDI bitmap |
| xtFloodFill† loodFill | Fills display surface within a border Fills area with current brush starting at X,Y | GDI bitmap |
| letBitmapBits | Copies ICount bits of bitmap to IpBits buffer | GDI bitmap |
| etBitmapbins etBitmapDimension | Returns width and height of bitmap | GDI bitmap |
| etBitmapDimension letPixel | | GDI bitmap |
| etBitmapBits | Retrieves RGB color of pixel at X,Y | GDI bitmap |
| etBitmapBits etBitmapDimension | Sets bitmap bits to values given at IpBits Associates width and height with a bitmap (in .1 mm) | GDI bitmap |
| etPixel | Sets pixel at X,Y to device color closest to rgbColor | GDI bitmap |
| tretchBit | Moves bitmap from source rect to destination rect | GDI bitmap |
| rrerchbit rtersectClipRect | Forms new clipping region from intersection | GDI clipping |
| ffsetClipRgn | Moves clipping region X units horiz and Y units vertically | GDI clipping |
| ectVisible | Determines if any part of IpRect lies within clipping rgn | GDI clipping |
| electClipRgn | Selects hRgn as current clipping region for disp context | GDI clipping |
| xcludeClipRect | Creates new clipping region for rectangle | GDI clipping |
| etClipBox | Copies clipping rect boundary to lpRect | GDI clipping |
| scape | Accesses device facilities not available through GDI | GDI control |
| | Abode current job | GDI control |
| scape (ABORTDOC) | Aborts current job Copies banding capability info to IpIndata structure | GDI control |
| scape (BANDINFO)* | Copies banding capability into to ipinioata structure | GDI control |
| scape (DEVICEDATA) scape (DRAFTMODE) | Send data directly to printer Turns draft mode ON or OFF | GDI control |
| | | GDI control |

| Excape (ENDODC) Ends print job started by Excape STARTDOC GID control Excape (ENDODC) Whose efficient StartOut for justification and kerning GID control Excape (FLUSHOUTPUT) Flushes output in device buffer GID control Excape (GETCOLORTABLE) GID control Excape (GETCOLORTABLE) GID control GExcape (GETCOLORTABLE) Flisb buffer with extended text metrics for fort GID control Excape (GETEXTENDEDTEXTMETRICS) Filis buffer with extended text metrics for fort GID control Excape (GETEXTENTER) Flisb buffer with extended text metrics for fort GID control Excape (GETPARINERNITABLE) Flisb buffer at IpOL/Data with kerning-pair table for fort GID control Excape (GETPARINERNITABLE) Flisb buffer at IpOL/Data Polint Structure GID control Excape (GETPARINERNITABLE) GID control GExcape (GETPARINERNITABLE) Flisb buffer at IpOL/Data Polint Structure GID control Excape (GETPARINERNITABLE) Flisb buffer at IpOL/Data Polint Structure GID control Excape (GETPARINERNITABLE) Flisb buffer at IpOL/Data Polint Structure GID control Excape (GETPARINERNITABLE) Flisb buffer at IpOL/Data Polint Structure GID control Excape (GETPARINERNITABLE) Flisb buffer at IpOL/Data Polint Structure GID control Excape (GETTARIOK) Florid GID control GEXcape (GUERYESCSUPPORT) Florid GID control GEXcape (GUERYESCSUPPORT) Florid GID control Gexcape (GUERYESCSUPPORT) Florid GID control Gexcape (GUERYESCSUPPORT) Florid GID control Gexcape (GUERYESCSUPPORT) Florid GID control Gexcape (GUERYESCSUPPORT) Florid GID control Gexcape (GUERYESCSUPPORT) Florid GID GID control Gexcape (GUERYESCSUPPORT) Florid GID control Gexcape (GUERYESCSUPPORT) Florid GID GID GID GID GID GID GID GID GID GID | |
| Escape (EXTEXTOUT) More efficient TextOut for justification and kerning GDI control Escape (EXTEXTOUT) Flushes output in device buffer GDI control Escape (GETCOLORTABLE) Copies RGB color table to ipOutData GDI control Escape (GETEXTENTERDEDTEXTMETRICS) Flish buffer with kended totan femicina for fort GDI control Escape (GETEXTENTERDEDTEXTMETRICS) Returns width of individual group of consec chars GDI control Escape (GETEXTENTTABLE) Returns width of individual group of consec chars GDI control Escape (GETPHAPERANTABLE) Flish buffer at IgOuData with hearing-pair table for fort GDI control Escape (GETPHAPERANTABLE) Flish buffer at IgOuData with hearing-pair table for fort GDI control Escape (GETPHAPERANTABLE) Copies printing offset to ipOutData POINT structure GDI control Escape (GETSHINTRIGOTESET) Copies printing offset to ipOutData PoiNT structure GDI control Escape (GETSACHNGFACTOR) Returns scaling factors for x and y axes of printer GDI control Escape (GETRACKVERNITABLE) Flis buffer at IgOuData with track-kerning lable for fort GDI control Escape (NEWFRAME) Ends withing to a page GDI control Escape (NEWFRAME) Ends withing to a page GDI control Escape (NEWFRAME) Ends withing to a band GDI control Escape (OUERWESCSUPPORT) Tests whelher device supports Escape GDI control Escape (SETABADI) Ends withing to a band GDI control Escape (SETABADI) Ends withing to a band GDI control Escape (SETABADI) Ends withing to a band GDI control Escape (SETABADI) Ends withing to a band GDI control Escape (SETABADI) Ends withing to a band GDI control Escape (SETABADI) Ends withing to a band GDI control Escape (SETABADI) Ends withing to a band GDI control Escape (SETABADI) Ends withing to a band GDI control Escape (SETABADI) Ends withing to a band GDI control Escape (SETABADI) Ends withing to a band GDI control Escape (SETABADI) Sets text justification values GDI control Es | |
| Escape (ELUSHOUTPUT) Flushes output in device buffer GDI control | |
| Escape (GETCOLORTABLE) Copies RGB color table to pOutData GDI control | |
| Escape (GETEXTENTTABLE) Returns width of Individual group of consec chars GDI control | |
| Escape (GETEXTENTTABLE) Returns width of Individual group of consec chars GDI control | |
| Escape (GETPARRECRITABLE) Fills buffer at IpOutData with kerning-pair table for font GDI control | |
| Escape (GETPHYSPAGES)ZE Copies physical page size to [pOutData POINT structure GDI control | |
| Escape (GETPAINTINGOFFSET) Copies printing offset to DoutData POINT structure GDI control | |
| Escape (EETRALNGFACTOR) Returns scaling fectors for x and y axes of printer GDI control | |
| Escape (RECOMMENT) Fills buffer at [OUtData with track-kerning table for font GDI control | |
| Escape (NFCOMMENT)* Adds comment to metallie GDI control | |
| Escape (NEWFRAME) Ends withing to a page GDI control | |
| Escape (NEXTBAND) Ends whiting to a band GDI control | |
| Escape (SELECTPAPERSQUPICE) Determines and selects available paper sources GDI control | |
| Escape (SETABORTPROC) Sets abort function for print task GDI control | |
| Escape (SETALLUSTYALUES) Sets text justification values GDI control | |
| Escape (SETCOLORTABLE) Sets RGB color table entry GDI control | |
| Escape (SETCEPYCOUNT) Specifies number of copies per page to print (uncollated) GDI control Escape (SETKERNTACK) Specifies which kerning track to use GDI control Escape (SETKERNTACK) Sepcifies which kerning track to use GDI control Escape (SETLINECAP) Sets line end cap GDI control Escape (SETLINECAP) Sets how line segments joined GDI control Escape (SETLINECAP) Sets miter limit for a device GDI control Escape (STARTOC) Starts print task GDI control Escape (STARTOC) Starts print task GDI control GeltNearestColor GeltNearestColor GeltNearestColor GeltNearestColor GeltNearestColor Converts device color closest to rgbColor GDI control Converts Centre of the Converts Centre of the Color Converts GDI Control DPioLP Converts Gevice points into logical points GDI coordina Converts logical points to device points GDI coordina Converts Centre coords at IP-point to client coords GDI coordina Converts Centre coords at IP-point to client coords GDI coordina | |
| Escape (SETKERNTRACK) Specifies which kerning track to use GDI control | |
| Escape (SETLINECAP) Sets line end cap GDI control | |
| Escape (SETLINEJON) Sets how line segments joined GDI control | |
| Escape (SETMITERLIMIT) Sets miter limit for a device GDI control | |
| Escape (STARTDOC) Starts print task GDI control | |
| Escape (STRETCHBLT) Implements StretchBlt on driver level GDI control GelNearestColor Returns device color closest to rgbColor GDI conversion ClientToScreen Converts client coords to equiv screen coords GDI coordina DPIGLP Converts device points into logical points GDI coordina LProDP Converts device points to device points GDI coordina ScreenToClient Converts screen coords at [Pprint to client coords GDI coordina | |
| GelNearesiColor Returns device color closest to rgbColor GDI conversi Client ToScreen Conversi Celent covids GDI coordina GDI coordina GDI coordina GDI coordina GDI coordina GDI coordina GDI coordina GDI coordina CDI coordina CDI coordina CDI coordina CDI coordina GDI coordina GDI coordina GDI coordina GDI coordina GDI coordina GDI coordina GDI coordina | |
| ClientToScreen Converts client coords to equiv screen coords GDI coordina DPIGLP Converts device points into logical points GDI coordina LProDP Converts togical points to device points GDI coordina ScreenToClient Converts screen coords at IpPoint to client coords GDI coordina | |
| DPoLP Converts device points into logical points GDI coordina LPoDP Converts logical points to device points GDI coordina CPoDP Converts logical points to device points GDI coordina Converts screen coords at Point to client coords GDI coordina Converts screen coords at Point to client coords | |
| LPtoDP Converts logical points to device points GDI coordina ScreenToClient Converts screen coords at lpPoint to client coords GDI coordina | |
| | |
| | |
| CreateCompatibleDC Creates memory display context compat with hDC GDI device or | ontext |
| CreateDC Creates display context for specified device GDI device or | |
| CreateIC Creates information context for device GDI device or | |
| Delete DC Deletes specified display context GDI device or | |
| GetDCOrg* Returns origin for display context GDI device or | |
| RestoreDC Restores display context to previous state GDI device or | ontext |
| SaveDC Saves current state of display context GDI device or CreateDIBitmap Creates device-specific bitmap from DIB GDI DIB | ontext |
| CreateDIBitmap Creates device-specific bitmap from DIB GDI DIB GetDIBits† Returns bits for device-specific bitmap GDI DIB | |
| SetDIBitsToDevice Sets bits on a device surface directly from a dIB GDI DIB | |
| Set DIBits † Sets memory bitmap's bits from a DIB GDI DIB | |
| StreichDIBits† Moves DIB from source rect to dest rect GDI DIB | |
| GetReiAbs‡ Returns the relabs flag GDI display of | ontext |
| SetReiAbs‡ Sets the relabs flag GDI display | ontext |
| CreateBrushIndirect Creates logical brush from existing brush GDI drawing | |
| CreateDIBPatternBrush† Creates logical brush from pattern defined by DIB GDI drawing | |
| CreateHatchBrush Creates logical brush with hatched pattern GDI drawing | |
| CreatePatternBrush Creates logical brush with hBitmap pattern GDI drawing | |
| CreatePen Creates logical pen GDI drawing | |
| CreatePenIndirect Creates logical pen like lpLogPen GDI drawing | |
| CreateSolidBrush Creates logical brush of a solid color GDI drawing | |
| Delete Object Deletes object by freeing system storage GDI drawing | |
| EnumObjects Enumerates objects available on device GDI drawing | |
| GetBkColor Returns current background color of device GDI drawing | |
| GetBkMode Returns background mode of device GDI drawing | |
| GetBrushOrg Returns current brush origin GDI drawing | |
| GetObject Copies nCount bytes of hObject data to IpObject GDI drawing | |
| GetPolyFillMode Returns current polygon filling mode GDI drawing | |
| GelROP2 Returns current drawing mode GDI drawing | |
| GelStreichBitMode Returns current streiching mode GDI drawing GelTextColor Returns current text color GDI drawing | |
| | |
| | |
| SetBk/Color Sets background color to closest to rgbColor GDI drawing SetBkMode Sets background mode GDI drawing | |
| Sets background mode Solis background mode S | |
| Set PolyFillMode Sets polygon filling mode for hDC GDI drawing | |
| Sets polygon mining mode for nDC Solid drawing sets polygon mining mode for nDC Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing mode Solid drawing Mode Solid drawing Mode Solid drawing Mode Solid drawing mode Solid drawing Mode Solid dra | |
| SetStretchBitMode Sets stretching mode for StretchBit function GDI drawing | |
| SetTextColor Sets text color to device color closest to rqbColor GDI drawing | |
| UnrealizeObject Directs GDI to reset origin of brush when it is selected GDI drawing | |
| GetStockObject Returns handle to predefined object GDI drawing | |

| Function Name | Description | |
|-------------------------------------|---|------------------------------------|
| GetEnvironment | Copies device environment to InEnviron | Type GDI environment |
| SetEnvironment | Copies data at IpEnviron to device at IpPortName | GDI environment |
| AddFontResource | Adds resource in lpFilename to system font table | GDI font |
| CreateFort | Creates logical fort | GDI font |
| CreateFontIndirect EnumFonts | Creates logical font like lpLogFont Enumerates fonts available on device | GDI fort |
| GetAspectRatioFilter | Get setting of current aspect-ratio filter | GDI fort |
| GetCharWidth* | Retrieves width of a character | GDI fort |
| RemoveFontResource | Removes font from font table | GDI font |
| SetMapperFlags* | Alters algorithm used by font mapper | GDI font |
| GetDeviceCaps | Returns device-specific info | GDI information |
| Arc LineDDA | Draws arc from X3,Y3 to X4,Y4 Computes successive points in line X1,Y1 X2,Y2 | GDI line output |
| LineTo | Draws line from current pos up to X,Y (but not X,Y) | GDI line output GDI line output |
| MoveTo | Moves current position to point X.Y | GDI line output |
| Polyline | Draws set of line segments | GDI line output |
| GetMapMode | Returns current mapping mode | GDI mapping |
| GetViewportExt | Returns x-/y-extents of display context's viewport | GDI mapping |
| GetViewportOrg GetWindowExt | Returns x-/y-coords of display context viewport org. | GDI mapping |
| GetWindowOrg | Returns x-/y-extents of display context's window Returns x-/y-coords of display context window origin | GDI mapping GDI mapping |
| OffsetViewportOrg* | Modifies viewport origin relative to current values | GDI mapping |
| OffsetWindowOrg* | Modifies window origin relative to current values | GDI mapping |
| ScaleViewportExt* | Modifies viewport extents relative to current values | GDI mapping |
| ScaleWindowExt* | Modifies window extents relative to current values | GDI mapping |
| SetMapMode | Sets mapping mode of hDC | GDI mapping |
| SetViewportExt | Sets x-/y-extents of viewport for hDC | GDI mapping |
| SetViewportOrg SetWindowExt | Sets viewport origin for hDC Sets x-/y-extents of window of hDC | GDI mapping GDI mapping |
| SetWindowOrg | Sets window origin of hDC | GDI mapping |
| CloseMetaFile | Closes metafile and creates handle | GDI metafile |
| CopyMetaFile | Copies metafile to IpFilename and returns new hMF | GDI metafile |
| CreateMetaFile | Creates metafile display context | GDI metafile |
| DeleteMetaFile | Deletes access to metafile; frees system resources | GDI metafile |
| EnumMetaFile* | Enumerates GDI calls in a metafile | GDI metafile |
| GetMetaFile GetMetaFileBits | Creates handle for metafile named by IpFilename | GDI metafile GDI metafile |
| PlayMetaFile | Stores metafile bits in global memory block Plays contents of metafile on device context hDC | GDI metafile |
| PlayMetaFileRecord* | Plays metafile record by executing GDI calls | GDI metafile |
| SetMetaFileBits | Creates memory metafile from data in memory block | GDI metafile |
| Chord* | Draws a chord (ellipse intersection with line segment) | GDI output |
| Ellipse | Draws ellipse with center in X1,Y1 X2,Y2 rect | GDI output |
| GetCurrentPosition | Returns logical coords of current position | GDI output |
| Pie | Draws arc and connects two end points to center | GDI output |
| Polygon Bol-Bol-cook | Draws polygon | GDI output GDI output |
| PolyPolygon† Rectangle | Draws a series of closed polygons Draws rectangle | GDI output |
| RoundRect | Draws rounded rectangle | GDI output |
| AnimatePalette† | Replaces entries in logical palette | GDI palette |
| CreatePalette† | Creates logical palette | GDI palette |
| GetNearestPaletteIndex† | Returns index of logical palette entry closest to RGB color | GDI palette |
| GetPaletteEntries† | Returns entries from logical palette | GDI palette |
| GetSystemPaletteEntries† | Returns range of entries from system palette | GDI palette |
| GetSystemPaletteUse† | Determines if application has full access to system palette | GDI palette |
| RealizePalette† | Maps entries in logical palette to system palette Selects logical palette into device context | GDI palette |
| SetPaletteEntries† | Sets new palette entries in a logical palette | GDI palette |
| SetSystemPaletteUse† | Allows application to use full system palette | GDI palette |
| JpdateColors† | Performs pixel-by-pixel translation to system palette colors | GDI palette |
| CombineRgn | Combines two existing regions into new region | GDI region |
| CreateEllipticRgn | Creates elliptical region bounded by rect X1,Y1 X2,Y2 | GDI region |
| PreateEllipticRgnIndirect* | Creates elliptical region bounded by IpRect | GDI region |
| CreatePolygonRgn | Creates polygonal region | GDI region GDI region |
| CreatePolyPolygonRgn† | Creates region of a series of closed polygons | GDI region |
| CreateRectRgn CreateRectRgnIndirect | Creates rectangular region Creates rectangular region sized like lpRect | GDI region |
| PreateRoundRectRegion† | Creates rounded rectangular region | GDI region |
| qualRgn | Determines if two regions are identical | GDI region |
| illRgn | Fills region with specified brush | GDI region |
| rameRgn | Draws border for region | GDI region |
| GetRgnBoxt | Returns coordinates of bounding region | GDI region GDI region |
| nvertRgn | Inverts colors in hRgn | GDI region |
| OffsetRon | Moves region X unit horiz and Y units vertically | GDI region |
| Palmingn | Fills hRgn with current brush | GDI region |
| MnRegion | Determines whether X,Y is within hRgn | 100.7090 |

| Function Name | Description | Туре |
|----------------------------------|--|----------------------------------|
| PtVisible | Determines whether X,Y is in clipping region of hDC | GDI region |
| RectinRegion | Tests whether any part of rectangle is in region | GDI region |
| SetRectRgn* | Creates rectangular region | GDI region |
| ExtTextOut* GetTabbedTextExtent† | Writes character string within rect region on display Computes width and height of line of text with tabs | GDI text |
| GetTextAlign* | Returns status of text alignment flag | GDI text |
| GetTextExtent | Computes width and height of text line in lpString | GDI text |
| GetTextFace | Copies current font facename to IpFacename | GDI text |
| GetTextMetrics | Fills buffer with metrics for current font | GDI text |
| SetTextAlign* | Sets text alignment flag | GDI text |
| SetTextJustification | Prepares GDI to justify text line | GDI text |
| TabbedTextOut† TextOut | Writes character string with expanded tabs in current font Writes character string at X,Y | GDI text |
| GetTextCharacterExtra | Returns current intercharacter spacing | GDI text GDI text justify |
| SetTextCharacterExtra | Sets amount of intercharacter spacing | GDI text justify |
| DefineHandleTable† | Creates private handle table in default data segment | Memory manager |
| GetFreeSpace† | Returns number of bytes of memory available in global heap | Memory manager |
| GetWinFlags† | Returns 32-bit value specifying memory configuration | Memory manager |
| GlobalAlloc | Allocates dwBytes of memory from global heap | Memory manager |
| GlobalCompact GlobalDiscard | Compacts global memory to free dwMinFree bytes | Memory manager |
| GlobalDiscard GlobalDosAlloct | Discards global memory block if ref count is zero Allocates global memory which can be accessed by DOS | Memory manager Memory manager |
| GlobalDosFree† | Frees global memory which can be accessed by DOS | Memory manager Memory manager |
| GlobalFlags | Returns memory type of global memory block | Memory manager |
| GlobalFree | Removes global memory block if ref count is zero | Memory manager |
| GlobalHandle | Returns handle of global memory object | Memory manager |
| GlobalLock | Returns address of block, locks it in mem, increases ref count | Memory manager |
| GlobalLRUNewest† | Moves global memory object to newest LRU position | Memory manager |
| GlobalLRUOIdest† | Moves global memory object to oldest LRU position | Memory manager |
| GlobalNotify GlobalReAlloc | Installs notification procedure for current task | Memory manager |
| GlobalSize | Reallocates global memory block to dwBytes Returns the size of global memory block, in bytes | Memory manager Memory manager |
| GlobalUnlock | Unlocks block, decreases reference count | Memory manager |
| GlobalUnwire* | Unlocks memory segment | Memory manager |
| GlobalWire* | Moves segment to low memory and locks it | Memory manager |
| LimitEMSPages | Limits EMS memory Windows assigns to application | Memory manager |
| LocalAlloc | Allocates wBytes of memory from local heap | Memory manager |
| LocalCompact | Compacts local memory to generate wMinFree free bytes | Memory manager |
| LocalDiscard | Discards local memory block hMem if ref count is zero | Memory manager |
| LocalFlags LocalFree | Returns memory type of block hMem Frees local memory block hMem if ref count is zero | Memory manager Memory manager |
| LocalFreeze‡ | Prevents compaction of local heap | Memory manager |
| LocalHandle | Returns handle of local memory object at wMem | Memory manager |
| LocalHandleDelta | Sets entry count for each new handle table in local heap | Memory manager |
| Localinit | Initializes the local heap | Memory manager |
| LocalLock | Returns address of block, locks block, increases ref count by 1 | Memory manager |
| LocalMelt‡ | Permits compaction of local heap | Memory manager |
| LocalNotify‡ | Sets callback function for handling notification messages | Memory manager |
| LocalReAlloc LocalShrinkt | Reallocates local memory block hMem to wBytes | Memory manager |
| LocalSize | Shrinks specified memory heap Returns the size of local block hMem, in bytes | Memory manager Memory manager |
| LocalUnlock | Unlocks local memory block, decreases ref count by 1 | Memory manager |
| LockData | Locks data segment in memory | Memory manager |
| LockSegment | Locks segment at address wSegment | Memory manager |
| SetSwapAreaSize* | Changes amount of memory used by code segment | Memory manager |
| SwitchStackBack† | Returns stack of current task to task's DS | Memory manager |
| SwitchStackTot | Changes stack of current task to segment IDed by wStackSegment | Memory manager |
| UnlockData | Unlocks data segment | Memory manager |
| UnlockSegment FreeLibrary | Unlocks wSegment Removes library module if reference count is zero | Memory manager Module manager |
| FreeModule† | Decreases reference count of loaded module by 1 | Module manager Module manager |
| FreeProcInstance | Removes function instance at address IpProc | Module manager |
| GetCodeHandle | Returns handle of code segment containing function | Module manager |
| GetCodeHandle | Determines which code segment contains function in IpProc | Module manager |
| GetInstanceData | Copies nCount bytes from hInstance to current Instance | Module manager |
| GetModuleFileName | Copies module filename to lpFilename | Module manager |
| GetModuleHandle | Returns module handle | Module manager |
| GetModuleUsage | Returns reference count of module hModule | Module manager |
| GetProcAddress | Returns address of IpProcName function | Module manager |
| GetVersion | Returns Windows version number | Module manager |
| Loadicon MakeProcinstance | Loads icon named by IpIconName | Module manager Module manager |
| ProfCleart | Returns address for IpProc Discards all samples in sampling buffer if Profiler running | Optimizing |
| Proficient ProfFinisht | Stops sampling and flushes buffer to disk if Profiler running | Optimizing |
| ProfFlusht | Flushes sampling buffer to disk if Profiler running | Optimizing |
| | | |

| Function Name | Description | Түрө |
|----------------------------------|--|--|
| ProfinsChk† | Determines whether Profiler installed | Optimizing |
| ProfSampRate† | Sets rate of code sampling if Profiler running | Optimizing |
| ProfSetup† | Specifies size of output buffer if Profiler running in 386 enhanced Starts sampling if Profiler running | Optimizing |
| ProfStopt | Stops sampling if Profiler running | Optimizing |
| SwapRecordingt | Begins or ends analyzing swapping behavior if Swap running | Optimizing Optimizing |
| DOS3Call† | Issues a DOS 21H interrupt function request | OS interrupt |
| NetBIOSCall† | Issues a NETBIOS 5CH interrunt | OS interrupt |
| DeviceCapabilities | Gets printer driver capabilities | Printer control |
| ExtDeviceMode | Gets or changes driver initialization | Printer control |
| SetPriority‡ | Sets task priority | Printer control |
| AccessResource AllocResource | Sets file pointer for read access to hRefInfo | Resource manager |
| FindResource | Allocates dwSize bytes of memory for hResInfo Locates resource lpName of type IpType | Resource manager |
| FreeResource | Removes resource from memory if ref count is zero | Resource manager Resource manager |
| LoadAccelerators | Loads accelerator table named by IpTableName | Resource manager |
| LoadBitmap | Loads bitmap named by IpBitmapName | Resource manager |
| LoadCursor | Loads cursor named by IpCursorName | Resource manager |
| LoadLibrary | Loads library module named by IpLibFileName | Resource manager |
| LoadMenu | Loads menu named by IpMenuName | Resource manager |
| LoadResource | Loads the resource named by hResinfo | Resource manager |
| LoadString LockResource | Loads string wID into buffer IpBuffer | Resource manager |
| PatBit | Returns address of hResinfo, locks it, increases ref count by 1 Combines bit pattern with one already on device | Resource manager Resource manager |
| SetResourceHandler | Sets function address of resource handler | Resource manager |
| SizeofResource | Returns size of resource hResinfo, in bytes | Resource manager |
| UnlockResource* | Unlocks resource, decrements reference count | Resource manager |
| AllocDStoCSAlias† | Returns a CS selector to execute code in DS | Segment |
| AllocSelector† | Allocates a new selector | Segment |
| ChangeSelector† | Generates a code selector that corresponds to a data selector | Segment |
| FreeSelectort | Frees selector allocated by AllocSelector | Segment |
| GetCodeInfo† | Returns pointer to array containing CS information for lpProc | Segment |
| GlobalFix† GlobalPageLock† | Prevents global memory block from moving in linear memory | Segment |
| GlobalPageUnlock† | Increments page lock count of memory selector Decrements page lock count of memory selector | Segment Segment |
| GlobalUnfixt | Unlocks global memory block | Segment |
| CloseSound | Closes play device (first flushes voice queues) | Sound |
| CountVoiceNotes | Returns number of notes in voice queue | Sound |
| GetThresholdEvent | Returns pointer to threshold flag | Sound |
| GetThresholdStatus | Returns bit mask containing threshold event status | Sound |
| OpenSound | Opens play device for exclusive use | Sound |
| SetSoundNoise | Sets source and duration of noise from play device | Sound |
| SetVoiceAccent | Places an accent in voice queue | Sound |
| SetVoiceEnvelope SetVoiceNote | Places envelope in voice queue | Sound Sound |
| SetVoiceQueueSize | Places note in voice queue Allocates nBytes of memory for voice queue | Sound |
| SetVoiceSound | Places frequency and duration in voice queue | Sound |
| SetVoiceThreshold | Sets threshold level for voice queue | Sound |
| StartSound | Starts play in each voice queue | Sound |
| StopSound | Stops playing all voices | Sound |
| SyncAllVoices | Places sync mark in each voice queue | Sound |
| WaitSoundState | Waits until play driver enters nState | Sound |
| AnsiLower | Converts string IpStr to lowercase | String translation |
| AnsiLowerBuff† | Converts string in buffer to lowercase | String translation |
| AnsiNext | Points to next character in string IpCurrentChar | String translation String translation |
| AnsiPrev AnsiToOEM | Points to prev character in string lpStart Converts ANSI string to OEM char string | String translation |
| AnsiToOemBuff† | Converts ANSI string to OEM char string Converts ANSI string in buffer to OEM char string | String translation |
| AnsiUpper | Converts string IpStr to uppercase | String translation |
| AnsiUpperBuff† | Converts string in buffer to uppercase | String translation |
| isCharAlphaNumeric† | Determines whether character is an alphabetical or numeric char | String translation |
| IsCharAlpha† | Determines whether character is an alphabetical character | String translation |
| IsCharLowert | Determines whether character is a lowercase character | String translation |
| IsCharUppert | Determines whether character is an uppercase character | String translation |
| Istrcat | Concatenates IpString2 to string specified by IpString1 | String translation |
| Istrempi† | Compares two strings and returns value indicating relationship | String translation |
| istrempt | Compares two strings and returns value indicating relationship | String translation |
| Istropy† | Copies IpString2 to IpString1 | String translation |
| OemToAnsi | Returns length of lpString in bytes | String translation |
| OemToAnsiBuff | Translates IpOemStr to OEM-defined char set Translates string in buffer to OEM-defined char set | String translation |
| | Translates string in buildrid o'Demodrinied charset Translates virtual-key code and current keyboard state | String translation |
| | | Tour and the second |
| ToAscii† | Formats and stores series of chars in buffer | String translation |
| wsprintf† | Formats and stores series of chars in buffer Formats and stores series of chars in buffer Copies current exec environ to buffer ipCatchBuf | String translation Task |

| Function Name | Description | |
|--|---|--------------------------------------|
| ExitWindows† | Initiates standard Windows shutdown procedure | Type Task |
| GetCurrentPDB† | Returns paragraph address of selector of DOS PSP | Task |
| GetCurrentTask | Returns handle of current task | Task |
| GetDOSEnvironment† | Returns far pointer to environment string of current task | Task |
| GetNumTasks* | Returns number of tasks in system | Task |
| SetErrorMode Throw | Controls whether Windows or application handles DOS 24H errors Restores execution environment to values in IpCatchBuf | Task Task |
| Yield | Halts current task and starts any waiting task | Task |
| DeviceMode | Displays dialog box for setting printer modes | Utility |
| GetBValue | Returns blue component of rgbColor | Utility |
| GetGValue | Returns green component of rgbColor | Utility |
| GetRValue | Returns red component of rgbColor | Utility |
| HIBYTE | Returns hi-order byte of ninteger | Utility |
| HIWORD | Returns hi-order word of linteger | Utility |
| LOBYTE | Returns lo-order byte of ninteger Returns lo-order word of linteger | Utility |
| MAKEINTATOM | Casts integer as argument for AddAtom | Utility |
| MAKEINTRESOURCE | Casts integer as argument for AddAtom | Utility |
| MAKELONG | Creates unsigned long integer | Utility |
| MAKEPOINT | Converts long value into a POINT structure | Utility |
| max | Returns maximum value of A and B | Utility |
| min | Returns minimum value of A and B | Utility |
| MulDivt | Multiplies two words and divides result by a third word | Utility |
| PALETTEINDEX† | Returns value of palette entry in LO bytes | Utility |
| PALETTERGB† | Returns value of palette entry in LO bytes Creates RGB color from individual color values | Utility |
| RGB WndProc‡ | Processes messages sent to it | Utility Window |
| GetSysModalWindow | Returns handle of system modal window, if present | Window attribute |
| CreateCaret | Creates caret for hWnd using hBitmap | Window caret |
| DestroyCaret | Destroys current caret and memory it occupies | Window caret |
| GetCaretBlinkTime | Returns current caret flash rate | Window caret |
| GetCaretPos* | Returns current caret position | Window caret |
| HideCaret | Removes system caret from window | Window caret |
| SetCaretBlinkTime | Establishes caret flash rate | Window caret |
| SetCaretPos | Moves caret to X,Y position | Window caret |
| ShowCaret CallWindowProc | Displays new caret or redisplays hidden caret Passes message info to IpPrevWindFunc function | Window caret Window class |
| Change Clipboard Chain | Removes hWnd from clipboard viewer chain | Window clipboard |
| CloseClipboard | Closes the clipboard | Window clipboard |
| CountClipboardFormats | Counts number of formats clipboard can render | Window clipboard |
| EmptyClipboard | Empties clipboard, frees data handles | Window clipboard |
| EnumClipboardFormats | Enumerates available clipboard formats | Window clipboard |
| GetClipboardData | Returns data from clipboard in specified format | Window clipboard |
| GetClipboardFormatName | Copies nMaxCount chars of format to IpFormatName | Window clipboard |
| GetClipboardOwner | Returns window handle of clipboard owner | Window clipboard Window clipboard |
| GetClipboardViewer GetPriorityClipboardFormat† | Returns window handle of 1st window in viewer chn Returns data from clipboard in prioritized format | Window clipboard |
| sClipboardFormatAvailable | Returns True if data is available in wFormat | Window clipboard |
| OpenClipboard | Open clipboard (prevents other apps from modifying) | Window clipboard |
| RegisterClipboardFormat | Registers new clipboard format | Window clipboard |
| SetClipboardData | Copies hMem into clipboard | Window clipboard |
| SetClipboardViewer | Adds hWnd to clipboard viewer chain | Window clipboard |
| AdjustWindowRect | Converts client rectangle to a window rectangle | Window creation |
| AdjustWindowRectEx | Computes size of window with extended style to fit client area | Window creation |
| CreateWindow | Creates tiled, popup, or child window | Window creation |
| CreateWindowEx† | Creates overlapped, popup, or child window w/ ext style | Window creation |
| DefDigProc† | Provides default processing for dialog-box messages | Window creation Window creation |
| DefFrameProc† DefMDIChildProc† | Provides default processing for MDI frame-window msgs Provides default processing for MDI child-window msgs | Window creation |
| DefWindowProc DefWindowProc | Does default processing for MDI child-willoow hisgs | Window creation |
| DestroyWindow | Sends WM DESTROY message; frees memory | Window creation |
| GetClassInfo† | Returns info about specified class | Window creation |
| GetClassLong | Returns info at nIndex in WNDCLASS structure | Window creation |
| 3etClassName | Copies nMaxCount chars of hWnd's class name | Window creation |
| GetClassWord | Returns info at nIndex in WNDCLASS structure | Window creation |
| GetLastActivePopup† | Determines which popup window was most recently active | Window creation |
| GetWindowLong | Returns information about window | Window creation |
| 3etWindowWord | Returns information about window | Window creation Window creation |
| RegisterClass | Registers a window class | Window creation |
| SetClassLong SetClassWord | Replaces long value at nIndex in WNDCLASS struct Replaces word at nIndex in WNDCLASS struct | Window creation |
| SetWindowLong | Changes window attribute identified by nIndex | Window creation |
| SetWindowWord | Changes window attribute specified by nindex | Window creation |
| JnregisterClass† | Removes window class from window-class table | Window creation |
| | | |

| Function Name | Description | Туре |
|--|---|--|
| CreateCursor | Creates cursor from two bit masks | Window cursor |
| DestroyCursor GelCursorPos | Destroys cursor Stores cursor position in POINT structure | Window cursor |
| SelCursor | Sets cursor shape to hCursor; removes if hCursor=Null | Window cursor |
| SetCursorPos | Sets mouse cursor to screen coords X.Y | Window cursor Window cursor |
| ShowCursor | Adds 1 to cursor display count if nonzero; otherwise -1 | Window cursor |
| CheckDigButton | Changes state of button | Window dialog box |
| CheckRadioButton | Changes checkmark to wIDCheckButton in group | Window dialog box |
| CreateDialog | Creates modeless dialog box Creates modeless dialog box like one in lpDialogTemplate | Window dialog box |
| CreateDialogIndirect* CreateDialogIndirectParam† | Creates modeless dialog box from template and passes data | Window dialog box Window dialog box |
| CreateDialogParamt | Creates modeless dialog box and passes data to it | Window dialog box |
| DialogBox | Creates modal dialog box | Window dialog box |
| DialogBoxIndirect* | Creates modal dialog box like hDTemplate | Window dialog box |
| DialogBoxIndirectParam† DialogBoxParam† | Creates modal dialog box like template and passes data to it Creates modal dialog box and passes dialog to it | Window dialog box |
| DigDirList | Fills nIDListBox with files matching lpPathSpec | Window dialog box Window dialog box |
| DlgDirListComboBox† | Fills combo box with names of files matching path | Window dialog box |
| DigDirSelect | Copies selection from nIDListBox to IpString | Window dialog box |
| DlgDirSelectComboBox† | Copies current selection from combo box to string | Window dialog box |
| EndDialog | Frees resources and destroys windows of dialog box | Window dialog box |
| GetDialogBaseUnits† GetDialogCtrlID† | Returns base dialog units Returns ID value of a control window | Window dialog box Window dialog box |
| GetDigitem | Returns dialog control handle | Window dialog box |
| GetDigitemint | Translates text of nIDDIgitem to integer value | Window dialog box |
| GetDigitemText | Copies nMaxCount chars of control text to lpString | Window dialog box |
| GetNextDigGroupItem* | Searches for next control in group of dialog controls | Window dialog box |
| GetNextDigTabitem* IsDialogMessage | Obtains handle for first control preceding another Determines whether IpMsq is intended for modeless dialog | Window dialog box Window dialog box |
| IsDiaButtonChecked | Returns state of nIDButton | Window dialog box |
| MapDialogRect | Converts dialog-box coords to client coords | Window dialog box |
| SendDigItemMessage | Sends message to nIDDIgItem within dialog box hDig | Window dialog box |
| SetDigitemint | Sets text of nIDDIgitem to string representing wValue | Window dialog box |
| SetDigitemText | Sets caption or text of nIDDIgItem to String | Window dialog box |
| ArrangelconicWindows† BeginDeferWindowPos† | Arranges iconic child windows Initializes memory used by DeferWindowPos function | Window display Window display |
| BringWindowToTop | Makes popup or child window the top window | Window display |
| CloseWindow | Closes specified window | Window display |
| DeferWindowPost | Records positioning info for window to be moved or resized | Window display |
| EndDeferWindowPos† | Positions or sizes several windows simultaneously | Window display |
| GetClientRect | Copies window client area coords to lpRect | Window display Window display |
| GetWindowRect GetWindowText | Copies dimensions of entire window to IpRect Copies window's caption into IpString | Window display |
| GetWindowTextLength | Returns length of window's caption or text | Window display |
| Islconic | Returns status of window (iconic or open) | Window display |
| lsWindowVisible | Determines whether hWnd is visible | Window display |
| IsZoomed* | Determines whether window is at maximum size | Window display |
| MoveWindow | Causes WM_SIZE message to be sent to hWnd | Window display |
| Openicon SetWindowPos* | Opens specified window | Window display Window display |
| SetWindowText | Changes size, position, ordering of window Sets window caption or text to IpString | Window display |
| ShowOwnedPopups* | Displays or hides all popup windows | Window display |
| ShowWindow | Displays or removes window as specified by nCmdShow | Window display |
| FlashWindow | Flashes window once | Window error |
| MessageBeep | Generates a beep when message box displayed | Window error |
| MessageBox EnableHardwareInput* | Creates message-box window | Window hardware |
| GetAsyncKeyState* | Enables/disables mouse and keyboard Determines whether key is up or down | Window hardware |
| GetInputState* | Determines whether there are input events in queue | Window hardware |
| GetKBCodePage† | Determines which OEM/ANSI tables are loaded | Window hardware |
| GetKeyboardState* | Copies status of virtual keys to a buffer | Window hardware |
| GetKeyNamText† | Retrieves string containing name of key from driver | Window hardware Window hardware |
| GetKeyState MapVirtualKey† | Returns state of virtual key Accepts virtual-key or scan code and returns vice versa | Window hardware |
| MapvirtualKey† OemKeyScan† | Maps OEM ASCII codes 0-FFH to OEM scan codes | Window hardware |
| SetKeyboardState* | Copies buffer to keyboard state table | Window hardware |
| SetKeyboardState* VkKeyState† | Translates ANSI char to virtual-key code | Window hardware |
| CallMsgFilter | Passes message and code to message filter funct | Window hook |
| DefHookProc* | Provides default hook processing of WM messages | Window hook Window hook |
| SetWindowHook UnhookWindowHook* | Installs system or application hook | Window hook |
| UnhookWindowHook* AnyPopup | Removes filter function from hook chain Indicates whether any popup window is visible | Window information |
| ChildWindowFromPoint | Determines which child window contains Point | Window information |
| | | |
| EnumChildWindows EnumTaskWindows* | Enumerates child windows of hWndParent Enumerates all windows associated with a task | Window information Window information |

| Function Name | Description | Туре |
|--|--|---------------------------------------|
| EnumWindows | Enumerates windows on screen | Window information |
| FindWindow | Returns handle of window | Window information |
| GetNextWindow ^e | Searches for next window handle | Window Information |
| GetParent GetTopWindow* | Retrieves window handle of window's parent (if any) Returns handle to top-level child window | Window information Window information |
| GetWindow ^a | Searches for window in window manager's list | Window information |
| GetWindowTask* | Returns task handle | Window information |
| IsChild | Returns True if window is child of hParentWnd | Window information |
| IsWindow | Determines whether hWnd is a valid, existing window | Window information |
| SetParent* WindowFromPoint | Changes parent window of child window | Window information |
| EnableWindow | Identifies window containing Point (in screen coords) Enables or disables mouse, keybd input to hWnd | Window information Window input |
| GetActiveWindow | Returns handle to active window | Window input |
| GetCapture* | Determines which window is receiving mouse input | Window input |
| GetCurrentTime | Returns elapsed time since boot | Window input |
| GetDoubleClickTime | Returns double-click time for mouse Returns handle of window with input focus | Window input |
| GetFocus GetTickCount* | Returns time since system started | Window input Window input |
| IsWindowEnabled | Returns state of hWnd input from mouse and keyboard | Window input |
| KillTimer | Kills timer event identified by hWnd and nIDEvent | Window input |
| ReleaseCapture | Release mouse input, restores normal processing | Window input |
| SetActiveWindow | Makes tiled or popup window the active window | Window input |
| SetCapture SetDoubleClickTime* | Causes mouse input to be sent to hWnd | Window input |
| SetFocus SetFocus | Sets mouse double-click time Assigns input focus to hWnd | Window input Window input |
| SetSysModalWindow | Makes window a system modal window | Window input |
| SetTimer | Creates system timer event | Window input |
| SwapMouseButton | Swaps meaning of left/right mouse buttons if bSwap=True | Window input |
| WinMain | Entry point for Windows application execution | Window main |
| RegisterWindowDestroy‡ | Locks windows from destruction by other tasks | Window manager |
| AppendMenu† ChangeMenu‡ | Appends menu item to menu Changes menu item in hMenu | Window menu Window menu |
| CheckMenultem | Changes checkmark status of menu item | Window menu |
| CreateMenu | Creates empty menu | Window menu |
| CreatePopupMenu† | Creates empty popup menu | Window menu |
| DeleteMenu† | Removes menu item and destroys associated popup menus | Window menu |
| DestroyMenu | Destroys hMenu and frees memory it occupied | Window menu |
| DrawMenuBar EnableMenuItem | Redraws menu bar Enables, disables, or grays menu item | Window menu Window menu |
| GetMenu | Returns handle to window's menu | Window menu |
| GetMenuCheckMarkDimensions† | Returns dimensions of checkmark bitmap | Window menu |
| GetMenultemCount* | Determines how many items are in hMenu | Window menu |
| GetMenultemID* | Obtains identifier for a menu item | Window menu |
| GetMenuState* | Identifies top-level menu | Window menu Window menu |
| GetMenuString GetSubMenu | Copies nMaxCount chars of menu label to lpString Returns menu handle of popup menu | Window menu |
| GetSystemMenu | Allows access to system menu | Window menu |
| HiliteMenultem | Hilites or unHilites top-level menu item | Window menu |
| InsertMenu† | Inserts menu item in menu | Window menu |
| LoadMenuIndirect* | Loads menu from lpMenuTemplate | Window menu |
| ModifyMenu† | Changes menu item | Window menu |
| RemoveMenu† SetMenu | Removes item from a menu Sets window menu to hMenu; removes if hMenu=Null | Window menu Window menu |
| SetMenultemBitmaps† | Associates bitmaps with menu item | Window menu |
| TrackPopupMenu | Displays popup menu and tracks user interaction | Window menu |
| DispatchMessage | Passes message to window function in MSG structure | Window message |
| GetMessage | Retrieves message | Window message |
| GetMessagePos | Returns mouse position scrn coords at last message | Window message |
| GetMessageTime InSendMessage | Returns time of last message Returns True if function is processing SendMessage | Window message Window message |
| nsenamessage PeekMessage | Places message (if any) at IpMsg | Window message |
| PostAppMessage | Posts message to application | Window message |
| PostMessage | Posts message in application queue | Window message |
| PostQuitMessage | Posts WM QUIT message to application | Window message |
| RegisterWindowMessage | Defines new, unique window message | Window message |
| ReplyMessage | Replies to message without returning control | Window message |
| SendMessage SetMessageQueue* | Sends message to window or windows | Window message Window message |
| SetmessageQueue- TranslateAccelerator | Creates new message queue Processes keyboard accelerators for menu commands | Window message |
| TranslateMDISysAccel | Process MDI child-window command accelerators | Window message |
| TranslateMessage | Translates virtual keystrokes into char messages | Window message |
| WaitMessage | Yields control to other application | Window message |
| BeginPaint | Prepares window for painting | Window painting |
| DrawFocusRect† | Draws rect in style used to indicate focus | Window painting |
| Drawlcon | Draws icon with upper-left corner at X,Y | Window painting |

| Function Name | Description | Type Window painting |
|----------------------------|---|-------------------------|
| Draw I ext | Draws nCount chars of IpString clipped in IpRect Marks end of window repainting | |
| | Marks end of window repainting | Window painting |
| ExcludeUpdateRon* | Excludes a region in window from clipping region for window | Window painting |
| FilRect | Fills rectangle using specified brush | Window painting |
| FrameRect | Draws border for rectangle | Window painting |
| GetDC | Returns display context of client area for window | Window painting |
| GetUpdateRect | Copies dim of rect that needs updating to IpRect | Window painting |
| GetUpdateRgn* | Copies window's update region to specified region | Window painting |
| GetWindowDC | Returns display context for entire window | Window painting |
| GrayString | Writes nCount chars of String using hBrush to gray | Window painting |
| nvalidateRect | Marks IpRect for repainting | Window painting |
| nvalidateRgn | Marks hRgn for repainting | Window painting |
| nvertRect | Inverts display bits of IpRect | Window painting |
| ReleaseDC | Release display context | Window painting |
| JpdateWindow | Notifies application when window needs redrawing | Window painting |
| /alidateRect | Releases rectangle lpRect from repainting | Window painting |
| /alidateRgn | Releases hRgn from repainting | Window painting |
| numProps | Passes each property of hWnd to IpEnumFunc | Window property |
| 3etProp | Returns handle associated with loString | Window property |
| RemoveProp | Removes IpString from property list | Window property |
| SetProp | Copies string and data handle to property list of hWnd | Window property |
| CopyRect | Copies an existing rectangle | Window rectangle |
| qualRect* | Determines whether two rectangles are equal | Window rectangle |
| nflateRect | Resizes IpRect by X units horiz and Y units vertically | Window rectangle |
| ntersectRect | Finds intersection of two rects, copies to IpDestRect | Window rectangle |
| sRectEmpty | Determines whether IpRect is empty | Window rectangle |
| OffsetRect | Moves rectangle X units horiz and Y units vertically | Window rectangle |
| MinRect | Determines whether point lies within loRect | Window rectangle |
| SetRect | Fills RECT struct at IpRect with given coords | Window rectangle |
| SetRectEmpty | Sets IpRect to empty rectangle (all coords zero) | Window rectangle |
| Join Rect | Stores union of two rectangles | Window rectangle |
| | | |
| GetScrollPos | Returns current position of scroll bar | Window scrolling |
| SetScrollRange | Copies min/max scroll-bar positions | Window scrolling |
| ScrollDC* | Scrolls rectangle of bits in display context | Window scrolling |
| ScrollWindow | Moves contents of client area by X-amount, Y-amount | Window scrolling |
| SetScrollPos | Sets scroll-bar elevator to nPos; redraws if nonzero | Window scrolling |
| etScrollRange | Sets min/max scroll-bar positions for scroll bar | Window scrolling |
| howScrollBar* | Displays or hides scroll bar | Window scrolling |
| BetSysColor | Returns system color identified by nIndex | Window system info |
| SetSystemMetrics | Returns information about system metrics | Window system info |
| etSysColors | Changes one or more system colors | Window system info |
| SetPrivateProfileInt† | Returns value of integer key from initialization file | Windows init file |
| ietPrivateProfileString† | Copies a character string from initialization file to buffer | Windows init file |
| SetProfileInt | Returns integer into from WIN.INI file | Windows init file |
| SetProfileString | Returns string into from WIN.INI file | Windows init file |
| /ritePrivateProfileString† | Copies character string into specified initialization file | Windows init file |
| ViteProfileString | Copies loString to WIN.INI file | Windows init file |

*Applies to versions of Windows beginning with 2.0. †Applies to versions of Windows beginning with 3.0. \$Debugging version of Windows only \$Not in Windows 3.0

6.099. WINDOWS WINMEM32.DLL LIBRARY FUNCTIONS

| Function Name | | Parameters (in order) | Parm Type | Parameter Definition | Return Value |
|-----------------------|------|-----------------------|-----------|---|------------------|
| GetWinMem32Version | WORD | None | | | LO=minor version |
| | | | | | HO=major version |
| Global16PointerAlloc | WORD | wSelector | WORD | | 0=success* |
| | | dwOffset | DWORD | Offset from first byte to alias to be created | |
| | | lpBuffer | LpDWORD. | Pointer to 4-byte location for pointer alias | |
| | 1 | dwSize | DWORD | Addressable size in bytes of region | |
| | 1 | wFlags | WORD | RESERVED (must be 0) | |
| Global16PointerFree | WORD | wSelector | WORD | Selector of object for allas to be freed | 0=success* |
| | 1 | dwAlias | DWORD | Pointer of alias to be freed | |
| | i | wFlags | WORD | RESERVED (must be 0) | |
| Global32Alloc | WORD | dwSize | DWORD | Initial size in bytes of block to allocate | 0=success* |
| | 1 | lpSelector | LPWORD | Pointer to word to receive selector | |
| | 1 | dwMaxSize | DWORD | Maximum size in bytes object will reach | |
| | 1 | wFlags | WORD | RESERVED (must be 0) | |
| Global32CodeAllas | WORD | wSelector | WORD | Selector of object for alias to be created | 0=success* |
| | | IpAlias | LPWORD | Pointer to word to receive CS selector | |
| | 1 | wFlags | WORD | RESERVED (must be 0) | ľ |
| Global32CodeAliasFree | WORD | wSelector | WORD | Selector of object for alias to be freed | 0=success* |
| | 1 | wAtias | WORD | USE32 code selector alias to be freed | |

6,100. DIAGNOSTIC AND FATAL ERROR CODES

| Value | Message |
|---------------|---|
| 1 (1) | Insufficient memory for allocation |
| 2 (2) | Error reallocating memory |
| 3 (3) | Memory cannot be freed |
| 4 (4) | Memory cannot be locked |
| 5 (5) | Memory cannot be unlocked |
| 6 (6) | Invalid handle passed to a GDI function |
| 7 (7) | Window handle not valid |
| 8 (8) | Cached display contexts are busy |
| 9 (9) | DefWindowProc function not found in application |
| A (10) | Clipboard already open |
| B (11) | Application attempted to destroy a window while using DC |
| C (12) | Keyboard driver not initialized correctly |
| D (12) | Mouse driver not initialized correctly |
| E (14) | Display driver not initialized correctly |
| | |
| F (15) | Unlocked segment should be locked |
| 10 (16) | Clipboard already open |
| 13 (19) | Mouse module not valid |
| 14 (20) | Display module not valid |
| 15 (21) | Unlocked data segment should be locked |
| 16 (22) | Invalid lock on system queue |
| 16 (22) | Class counter exceeded limit of 32, 767 |
| 17 (23) | Class counter became negative number |
| 18 (24) | Class counter not zero when class destroyed |
| 19 (25) | Message-box function was called during DLL's init routine |
| 100 (256) | Local memory errors |
| 103 (259) | LocalReAlloc Invalid local heap |
| 140 (320) | Local heap is busy |
| 143 (323) | Invalid local heap |
| 14B (331) | Invalid local heap |
| 15B (347) | Invalid local heap |
| 180 (384) | Invalid local handle |
| 1C0 (448) | LocalLock count overflow |
| 1F0 (496) | LocalUnlock count underflow |
| 200 (512) | Global memory errors |
| 240 (576) | Critical section problems |
| 280 (640) | Invalid global handle |
| 2C0 (704) | GlobalLock count overflow |
| 2F0 (752) | GlobalUnlock count underflow |
| 300 (768) | Task schedule errors |
| 300 (766) | |
| 301 (769) | Invalid task ID |
| 302 (770) | Invalid exit system call |
| 303 (771) | Invalid BP register chain |
| 400 (1024) | Dynamic loader/linker errors |
| 401 (1025) | Error during boot process |
| 402 (1026) | Error loading a module |
| 403 (1027) | Invalid ordinal reference |
| 404 (1028) | Invalid entry name reference |
| 405 (1029) | Invalid start procedure |
| 406 (1030) | Invalid module handle |
| 407 (1031) | Invalid relocation record |
| 408 (1032) | Error saving forward reference |
| 409 (1033) | Error reading segment contents |
| 410 (1034) | Error reading segment contents |
| 411 (1035) | Insert disk for specified file |
| 412 (1036) | Error reading nonresident table |
| 4FF (1279) | INT 3F handler unable to load segment |
| 500 (1280) | Resource manager/user profile errors |
| 501 (1281) | Missing resource table |
| 502 (1282) | Bad resource type |
| 503 (1283) | Bad resource type Bad resource name |
| | Pad resource file |
| 504 (1284) | Bad resource file |
| 505 (1285) | Error reading resource |
| 506 (1286) | Default value in get profile string was NULL |
| 600 (1536) | Atom manager errors |
| 700 (1792) | Input/Output package errors |
| LFFEE (65518) | Divide by zero |

6.101. WINDOWS LOGICAL COORDINATE MAPPING

| | | <u> </u> | |
|--------|--------|----------------------------------|-------|
| -32768 | | 1 | |
| | | | |
| | | 0.0 | |
| 0 | | (vlewport) | |
| | | (viewport) Physical Device | |
| 32767 | | | |
| | -32768 | [O | 32768 |

| Occadions | Custom | Terratores et | on Equations |
|-----------|--------|---------------|--------------|
| | | | |

| Coordinate 5 | system Transformation Equations |
|--------------|--|
| Variable | Meaning |
| xWO | The x coordinate of the window origin |
| yWO | The y coordinate of the window origin |
| xWE | The x component of the window extent |
| YWE | The y component of the window extent |
| xVO | The x coordinate of the viewport origin |
| yVO | The y coordinate of the viewport origin |
| xYE | The x component of the viewport extent |
| yVE | The y component of the viewport extent |
| Lx_ | The x coordinate in the logical coordinate system |
| Ly | The y coordinate in the logical coordinate system |
| Dx | The x coordinate in the physical coordinate system |
| Dy | The y coordinate in the physical coordinate system |

Thus:

Dx = (Lx - xWO) * xVE/xWE + xVO Dy = (Ly - yWO) * yVE/yWE + yVO Lx = (Dx - xVO) * (xWE/xVE) + xWO Ly = (Dy - yVO) * yWE/yVE + yWO

Note:

•The viewport generally, but not always, is the same as the physical device. •Width and height of the viewport must be >-1 and <32768.

6.102. WINDOW STYLES

| Style Name | Description | Restrictions | |
|----------------------|---|---|--|
| DS_LOCALEDIT\$ | Controls in dialog box use application's data | | |
| | segment memory | | |
| DS_MODALFRAME§ | Dialog box with modal dialog-box frame Can be used with title bar and system menu | | |
| DS_NOIDLEMSG§ | Suppresses WM_ENTERIDLE messages | | |
| DS_SYSMODAL§ | System-modal dialog box | | |
| WS BORDER | Window with a border | | |
| WS_CAPTION | Window with a caption bar Implies WS_BORDER | | |
| WS_CHILD | Child window Cannot be used with WS_POPUP | | |
| WS_CHILDWINDOW | Child window | Style WS_CHILD | |
| WS_CLIPCHILDREN | Exclude area occupied by child windows when drawing within parent | Used when creating parent window | |
| WS_CLIPSIBLINGS | Clip child windows relative to one another | Used with WS CHILD only | |
| WS_DISABLED | Window is initially disabled | | |
| WS DLGFRAME | Window with double border, no caption | | |
| WS GROUP† | Defines a group of controls | Group applies until next WS_GROUP | |
| WS HSCROLL | Window with horizontal scroll bar | | |
| WS ICONIC | Window is initially iconic For use with WS OVERLAPPED or | | |
| WS MAXIMIZET | Window is maximum size possible | | |
| WS MAXIMIZEBOXT | Window contains maximize box | | |
| WS MINIMIZET | Window is minimum size possible | | |
| WS MINIMIZEBOX† | Window contains minimize box | | |
| WS OVERLAPPEDT | Overlapping window | | |
| WS OVERLAPPEDWINDOW† | Window with WS OVERLAPPED, WS CAPTION. | | |
| | WS SYSMENU, WS THICKFRAME, | i | |
| | WS MINIMIZE BOX, WS MAXIMIZE BOX | | |
| WS POPUP | Popup window | Cannot be used with WS_CHILD | |
| WS_POPUPWINDOW | Window with styles WS_POPUP, WS_BORDER, WS_SYSMENU | | |
| WS SIZEBOX* | Window with a size box | Used with windows w/caption or scroll bars only | |
| WS SYSMENU | Window with system menu box in caption bar | Used with windows w/ caption bars only | |
| WS TABSTOP1 | Defines controls that can be moved to by tabbing | Tabbing applies until next WS_TABSTOP | |
| WS_THICKFRAME† | Window with thick frame, which can be used to size window | | |
| WS TILED* | Tiled window | | |
| WS_TILEDWINDOW* | Window with WS_TILED, WS_CAPTION, WS_SYSMENU, WS_SIZEBOX | | |
| VS VISIBLE | Window is initially visible | | |
| VS VSCROLL | Window with vertical scroll bar | | |

*Applies to Windows 1.0 only. †Applies to all versions of Windows beginning with 2.0. \$Applies to all versions of Windows beginning with 3.0.

Microsoft Windows 1.0 SDK Programmer's Reference, pages 28 through 29 Microsoft Windows 2.0 SDK Programmer's Reference, pages 199 through 200 Microsoft Windows 3.0 SDK Programmer's Reference, pages 8-16 through 8-18 Source:

6.103. WINDOWS FILE TYPES

| Bit is wFiletype | Meaning | Use |
|------------------|-----------------|---|
| 0 (0) | Normal file | Find all "normal" files |
| 1 (1) | Read-only file | Find all read-only files |
| 2 (2) | Hidden file | Find all hidden files |
| 3 (3) | System file | Find all System files |
| 10 (16) | Directory file* | Find all Directories |
| 20 (32) | Archive file* | Find all files with "archive" bit set |
| 2000 (8192) | LB DIR flag* | If set, Windows puts message in apps queue |
| 4000 (16384) | Drive bit* | |
| 8000 (32768) | Exclusive bit* | Find only files of the type listed (don't include normal files) |

*No longer documented in Windows 3.0

wFiletype is determined by ANDing together the bits for the file types you want to match. Note:

6.105. BINARY RASTER OPERATION CODES (ROP2)

| Operation | Boolean Op* | Function |
|----------------|-------------|--|
| R2 BLACK | 0 | Pixel is always black |
| R2 COPYPEN | P | Pixel is the pen color |
| R2 MASKNOTPEN | DPna | Pixel is combination of colors common to the display and inverse of pen |
| R2 MASKPEN | DPa | Pixel is combination of colors common to the pen and the display |
| R2 MASKPENNOT | PDna | Pixel is combination of colors common to the pen and inverse of display |
| R2 MERGENOTPEN | DPno | Pixel is a combination of display color and inverse of the pen color |
| R2 MERGEPEN | DPo | Pixel is a combination of pen color and the display color |
| R2 MERGEPENNOT | PDno | Pixel is a combination of pen color and the inverse of the display color |
| R2 NOP | D | Pixel remains unchanged |
| R2 NOT | Dn | Pixel is inverse of the display color |
| R2 NOTCOPYPEN | Pn | Pixel is inverse of pen color |
| R2 NOTMASKPEN | Dpan | Pixel is inverse of R2_MASKPEN |
| R2 NOTMERGEPEN | DPon | Pixel is inverse of R2_MERGEPEN color |
| R2 NOTXORPEN | DPxn | Pixel is inverse of R2_XORPEN color |
| R2 WHITE | 1 | Pixel is always white |
| R2 YORPEN | DPx | Pixel is combination of colors in pen and display, but not in both |

*Boolean operation is coded as follows:

D destination bitmap
P selected pen
a bitwise AND
n bitwise NOT (inverse)
o bitwise OR
x bitwise exclusive OR (XOR)

†Applies to all versions of Windows beginning with 3.0 (unnamed ROPs). *Boolean function is coded as follows:

D destination bitmap
P selected brush (pattern)
S source bitmap

a bitwise AND
n bitwise NOT (inverse)
o bitwise OR

x bitwise exclusive OR (XOR)

6.109. COMMON WINDOWS C COMPILER OPTIONS SUMMARY

| Command Lin | |
|-------------|--|
| Option | Function |
| -AC | Compiles application for compact memory model |
| -AL | Compiles application for large memory model |
| -AM | Compiles application for medium memory model |
| -AS | Compiles application for small memory model |
| Aw | Ensures pointers receive proper segment address when cast to 32-bit addresses |
| -c | Compiles only |
| -Gs | Removes stack probes to improve performance |
| -Gw | Adds Windows prolog and epilog to all functions |
| -GW | Substitutes a reduced Windows prolog and epilog to functions that are far calls within app |
| -Os | Optimizes for code size instead of speed |
| -Ow | Relaxes alias checking within constraints imposed by Windows* |
| -Zd | Creates object file for use with SYMDEB or WDEB386 |
| -Zi | Creates object file for use with CodeView for Windows |
| -Zp | Packs structures on single-byte boundaries |

°C 6.0 and later only

Version: Applies to Microsoft C 5.1 or later.

6.111. LINK MODULE DEFINITION STATEMENTS COMMAND SUMMARY

| Statement | Syntax | Function |
|-------------|----------------------|--|
| CODE | CODE options* | Defines code-segment attributes |
| DATA | DATA options* | Defines data-segment attributes |
| DESCRIPTION | DESCRIPTION 'string' | Describes the module |
| EXETYPE | EXETYPE WINDOWS | Tells LINK what type of .EXE header to use |
| EXPORTS | EXPORTS functionlist | Lists functions in module called by others |
| HEAPSIZE | HEAPSIZE bytes | Specifies default local heap size |
| IMPORTS | IMPORTS functionlist | Lists other functions called by the app |
| LIBRARY | LIBRARY name | Specifies module name of dynamic link lib |
| NAME | NAME name | Specifies module name of application |
| SEGMENTS | SEGMENTS options | Specifies attributes of added code or data segs |
| STACKSIZE | STACKSIZE bytes | Determines default size of local stack |
| STUB | STUB name | Specifies applications old-style executable file |

*Options include MOVEABLE, MULTIPLE, DISCARDABLE, and SINGLE.

Version: Applies to all versions of Windows beginning with 3.0.

6.112. WDEB386 DEBUGGER COMMAND SUMMARY

| Command Line Options | |
|----------------------|---|
| Option | Function |
| /√[p] | Enable verbose mode (p parm used for applications only) |
| /c:{1 2 3 4} | Specifies COM port for debugger output |
| /s:symfllespec | Specifies symbol file to load |

| WDEB386 Commands | |
|--|---|
| Command | Function |
| ? expr "string" | Display expression |
| ? | Display help |
| .? | Display external commands |
| .b baudrate [port] | Set COM port baud rate |
| .df | Display global free list |
| .dg [object] | Display global heap Display local heap |
| .dh .dm | Display global module list |
| .da | Dump task queue |
| .du | Display global LRU list |
| reboot | Reboot target system |
| bc {list *} | Clear breakpoints |
| bd { st *} | Disable breakpoints |
| be {list *} | Enable breakpoints |
| bl | List breakpoints |
| bp[n] addr [passcnt] ["cmds"] | Set breakpoints |
| c range addr | Compare memory |
| d (range) | Display memory |
| db [range] | Display bytes |
| dd [range] | Display double words |
| dg [a] [range] | Display GODT |
| di [a] [range] | Display IDT |
| di [a p s h] [range] | Display LDT |
| dt (addr) | Display TSS |
| dw [range] | Display words |
| e addr flisti | Enter byte |
| f range list | Fill memory |
| g [=addr [addr]] | Go |
| h word word | Hexadecimal arithmetic |
| i word | Input byte |
| expr ["cmds"] | Conditional execute |
| k [ss:bp] [cs:ip] | Backtrace stack |
| ka value | Set backtrace arguments |
| kt (tdb) | Backtrace task stack |
| kv | Verbose backtrace stack |
| a | List absolute symbols |
| g | List groups |
| m | List map |
| n [addr] | List map |
| s (group-name name-chars *) | List riear |
| m range addr | Move memory |
| b word byte | Output to port |
| p [N] [=addr] [count] | Program trace |
| r reg=word | Display registers |
| rreg=word s range {list "string"} | Search bytes |
| s range (list string) | Trace instructions |
| J range | Unassemble bytes |
| / [1 3] | Set Interrupt vector trapping |
| /[1 3] | Display Interrupt trapping information |
| | Change map |
| v [mapname] | |
| [? 386env dislwr regterse codebytes symaddres] | Debugger configuration options |
| | Zap embedded INT1 and INT3 instructions |
| zd | Execute default command string |
| zi | Display default command string |
| s "string" | Change default command string |

Version: Applies to all versions of Windows beginning with 3.0.

7.003. PC, AT, AND PS/2 MEMORY USAGE SUMMARY

| Address | Used By | Comments |
|-----------------|----------------------------|---|
| 00000 - 9FFFF | 640K on system board | May be 64K to 640K depending upon model |
| A0000 - BFFFF | Display adapter reserved | EGA and VGA use all of this; CGA and MDA use portion |
| C0000 - DFFFF | Reserved for ROM expansion | Used for I/O channel BIOS (as in XT disk controller) C0000-C3FFF EGA BIOS C6000-C63FF PGA communications area C8000-CBFFF hard-disk BIOS D0000-D7FFF cluster adapter BIOS D0000-DFFFF PCIr expansion cartridges |
| E0000 - EFFFF | Expansion of system ROM | As in AT, PS/2 (standard cartridges in PCir) |
| F0000 - FFFFF | System ROM | May be duplicate of ROM in higher memory |
| 100000 - 15FFFF | 384K on system board | Model 50, 60, and 80 only |
| 160000 - FDFFFF | Memory expansion | AT and PS/2 only |
| FE0000 - FEFFFF | RESERVED | AT and PS/2 only |
| FF0000 - FFFFFF | 64K ROM BIOS | AT and PS/2 only |

7.004. I/O PORT USAGE SUMMARY

| Hex Range | XT Use | AT Use (ISA and EISA) | PS/2 Use | Comments |
|-----------|------------------------------|--------------------------------|--------------------------------|---|
| 0-F | DMA controller (8237A-5) | DMA controller 1 (8237A-5) | DMA controller | |
| 10-1F | UNDOCUMENTED | DMA Controller 1 (8237A-5) | DMA controller | |
| 20-2F | Interrupt controller (8259A) | Interrupt controller 1 (8259A) | Interrupt controller 1 (8259A) | Only ports 20, 21 actually used |
| 30-3F | UNDOCUMENTED | Interrupt controller 1 (8259A) | UNDOCUMENTED | |
| 40-4F | Timer (8253-5) | Timer (8254-2) | System timers | XT uses 40-43; PS/2 uses 40,42-44, 47; EISA uses 48, 4A-4B |
| 50-5F | 1 | Timer (8254-2) | UNDOCUMENTED | |
| 60-6F | Parallel port (8255A-5) | Keyboard (8042) | Keyboard | XT uses 60-63; PS/2 uses 60-61, 64 |
| 70-7F | UNDOCUMENTED | RTC, NMI mask | RTC, NMI mask | PS/2 uses 70-71 only, reserves 74-76 |
| 80-8F | DMA page registers | DMA page registers (74LS612) | DMA page registers | XT uses 80-83; AT and PS/2 use 81-83, 87, 89-8B, 8F |
| 90-9F | DMA page registers | DMA page registers (74LS612) | I/O channel | PS/2 uses 90-94, 96-97 only |
| A0-AF | NMI mask register | Interrupt controller 2 (8259A) | Interrupt controller 2 (8259A) | PS/2 uses A0-A1 only |
| BO-BF | UNDOCUMENTED | Interrupt controller 2 (8259A) | UNDOCUMENTED | |
| CO-CF | UNDOCUMENTED | DMA controller 2 (8237A-5) | DMA controller | |
| D0-DF | UNDOCUMENTED | DMA controller 2 (8237A-5) | DMA controller | |
| E0-EF | UNDOCUMENTED | UNDOCUMENTED | Split address register, | PS/2 Model 80 only |
| | | | memory encoding register | |
| F0-FF | UNDOCUMENTED | Math coprocessor (80287) | Math coprocessor (80x87) | AT uses F0-F1, F8-FF only |
| | UNDOCUMENTED | UNDOCUMENTED | Programmable option select | PS/2 uses 100-107 only |
| 110-1EF | UNDOCUMENTED | UNDOCUMENTED | UNDOCUMENTED | |
| 1F0-1FF | UNDOCUMENTED | Fixed disk | UNDOCUMENTED | AT and ISA use IF0-IF8 only |
| | Game I/O adapter | Game I/O adapter | UNDOCUMENTED | Game I/O uses 200-207 only |
| | Expansion unit | UNDOCUMENTED | UNDOCUMENTED | XT uses 210-217 only |
| | UNDOCUMENTED | UNDOCUMENTED | UNDOCUMENTED | |
| 250-25F | UNDOCUMENTED | UNDOCUMENTED | UNDOCUMENTED | |
| 260-26F | UNDOCUMENTED | UNDOCUMENTED | UNDOCUMENTED | |
| | Parallel printer 2 | Parallel printer port 2 | Parallel port 3 | All use 278-27F, except PS/2 uses 278-27B |
| 280-28F | UNDOCUMENTED | UNDOCUMENTED | UNDOCUMENTED | |
| 290-29F | UNDOCUMENTED | UNDOCUMENTED | UNDOCUMENTED | |
| 2A0-2AF | UNDOCUMENTED | UNDOCUMENTED | UNDOCUMENTED | |
| 2B0-2BF | Alternate EGA | Alternate EGA | UNDOCUMENTED | |

7.004. I/O PORT USAGE SUMMARY (continued)

| Hex Range | XT Use | AT Use (ISA and EISA) | PS/2 Use | Comments |
|-----------|----------------------------------|-----------------------------------|-------------------------------------|---|
| 2C0-2CF | Alternate EGA | Alternate EGA | UNDOCUMENTED | - Serminoring |
| 2D0-2DF | Alternate EGA (3270 also uses) | Alternate EGA | UNDOCUMENTED | |
| | GAB 0, Data aguisition 0 | GPIB 0, data acquisition 0 | UNDOCUMENTED | XT and AT use 2E1, 2E2-2E3 only |
| 2F0-2FF | Serial port 2 | Serial port 2 | Serial port 2 (RS-232-C) | All use 2F8-2FF only |
| | Prototype card | Prototype card | UNDOCUMENTED | |
| 310-31F | Prototype card | Prototype card | UNDOCUMENTED | |
| | Fixed disk adapter | UNDOCUMENTED | UNDOCUMENTED | |
| | UNDOCUMENTED | UNDOCUMENTED | UNDOCUMENTED | |
| | DCA 3278 | UNDOCUMENTED | UNDOCUMENTED | XT uses 348-34F only |
| 350-35F | DCA 3278 | UNDOCUMENTED | UNDOCUMENTED | XT uses 350-357 only |
| 360-36F | PC network | RESERVED | UNDOCUMENTED | XT uses 360-367 only |
| | Parallel printer | Parallel printer 1 | Parallel port 2 | All use 378-37F, except PS/2 uses 378-37B |
| 380-38F | SDLC or second bisync controller | SDLC or second bisync controller | UNDOCUMENTED | |
| 390-39F | Cluster adapter | Cluster adapter | UNDOCUMENTED | XT uses 390-393 only |
| 3A0-3AF | First bisync controller | First bisync controller | UNDOCUMENTED | |
| 3B0-3BF | Monochrome display and printer | Monochrome display and printer | Video subsystem, parallel 1 | All use 3BC-3BF for parallel port |
| | adapter | adapter | 1 | |
| 3C0-3CF | Enhanced graphics adapter | Enhanced graphics adapter | Video subsystem | |
| 3D0-3DF | Color graphics adapter | Color graphics adapter | Video subsystem | |
| 3E0-3EF | UNDOCUMENTED | UNDOCUMENTED | UNDOCUMENTED | ISA uses 3E8-3EF only |
| 3F0-3FF | Floppy disk adapter, serial 1 | Floppy disk adapter, serial 1 | Diskette drive controller, serial 1 | 3F0-3F7 for disk, 3F8-3FF for async comm |
| 400-4FF | UNUSED* | EISA: DMA | UNUSED | |
| 500-7FF | UNUSED* | EISA: Alias of 100-3FF | UNUSED | |
| 800-8FF | UNUSED* | EISA: CMOS RAM | UNUSED | |
| 900-BFF | UNUSED* | EISA: Alias of 100-3FF | UNUSED | |
| C00-FFF | UNUSED* | EISA: Misc. Ports, RESERVED | UNUSED | |
| 1000-1FFF | UNUSED* | EISA: Slot 1 and alias of 100-3FF | Parallel 1, 4† | Alternates: 100H of slot, 200H of alias |
| 2000-2FFF | UNUSED* | EISA: Slot 2 and alias of 100-3FF | Video subsystem† | Alternates: 100H of slot, 200H of alias |
| 3000-3FFF | UNUSED* | EISA: Slot 3 and alias of 100-3FF | Serial 3, 4† | Alternates: 100H of slot, 200H of alias |
| 4000-4FFF | UNUSED* | EISA: Slot 4 and alias of 100-3FF | Serial 5, 6† | Alternates: 100H of slot, 200H of alias |
| 5000-5FFF | UNUSED* | EISA: Slot 5 and alias of 100-3FF | Serial 7, 8† | Alternates: 100H of slot, 200H of alias |
| 6000-6FFF | UNUSED* | EISA: Slot 6 and alias of 100-3FF | UNUSED | Alternates: 100H of slot, 200H of alias |
| 7000-7FFF | UNUSED* | EISA: Slot 7 and alias of 100-3FF | UNUSED | Alternates: 100H of slot, 200H of alias |
| | UNUSED* | EISA: Slot 8 and alias of 100-3FF | Serial 1, 2 DMA mode† | Alternates: 100H of slot, 200H of alias |
| | UNUSED* | EISA: Undefined | Serial 3-8 DMA mode† | 1 |

†PS/2 Model 90

The AT also uses additional ports in the range 6E2-E2E1 for GPIB, Cluster, and Data Acquisition adapters Note:

7.008. PC SYSTEM BOARD SWITCH SETTINGS

| For Switch 1 | | |
|---------------|------------------------|---|
| Switch Number | Function | Settings |
| 1 | Number of drives | ON=drives installed; OFF=no drives (see switch 7/8) |
| 2 | Not used (PC1) | Must be ON (PC1) |
| 3 & 4 | Memory on system board | ON ON = 16K (PC1) or 64K (PC2) |
| ! | | OFF ON = 32K (PC1) or 128K (PC2) |
| | | ON OFF = 48K (PC1) or 192K (PC2) |
| | ĺ | OFF OFF = 64K (PC1) or 256K (PC2) |
| 5 & 6 | Display adapter | ON ON = no adapter |
| | '''' | OFF ON = CGA, 40-columns |
| | 1 | ON OFF = CGA, 80 columns |
| | ľ | OFF OFF = MDA, or more than one adapter |
| 7 & 8 | Floppy drives | ON ON = 1 drive |
| | ''' | OFF ON = 2 drives |
| | | ON OFF = 3 drives |
| | | OFF OFF = 4 drives |

| Switch Number | Function | Settings |
|---------------|------------------|---|
| 1 through 5 | Memory Installed | ON ON ON ON = 16-64K* |
| • | i ' | OFF ON ON ON ON = 96K† |
| | 1 | ON OFF ON ON ON = 128K† |
| | | OFF OFF ON ON ON = 160Kt |
| | 1 | ON ON OFF ON ON = 192Kt |
| | | OFF ON OFF ON ON = 224K† |
| | i | ON OFF OFF ON ON = 256K† |
| | | OFF OFF OFF ON ON = 288K† |
| | 1 | ON ON OFF ON = 320K† |
| | | OFF ON ON OFF ON = 352K† |
| | | ON OFF ON OFF ON = 384K† |
| | 1 | OFF OFF ON OFF ON = 416K† |
| | ! | ON ON OFF OFF ON = 448K† |
| | ř | OFF ON OFF OFF ON = 480K† |
| | | ON OFF OFF OFF ON = 512K† |
| | | OFF OFF OFF ON = 544K† |
| | | ON ON ON OFF = 576K† |
| | | OFF ON ON ON OFF = 608K† |
| | | ON OFF ON ON OFF = 640K† |
| 6 - 8 | NOT USED | Must be OFF (switch 7 reserved for 8087 on PC2) |

*SW1 switches 3 & 4 control total memory. †SW1 switches 3 & 4 should be OFF.

 Extended means the first scan code returned is 00, followed by an extended ASCII code.
 Suppressed indicates the key combination is not passed by the keyboard routine in BIOS. Note:

¥The base case and uppercase of keys 105 through 108 differ in the source. The base case and uppercase used in this table are shown on the U.S. English keyboard diagram (page 4-33).

Note:

Some key numbers and scan-code numbers are missing because they are reserved by IBM.
 Suppressed indicates the key combination is not passed by the keyboard routine in BiOS.

†Only applicable to non-U.S. keyboards. Actual characters vary depending on the country of the keyboard.

 Some key numbers and scan-code numbers are missing because they are reserved by IBM.
 Suppressed indicates the key combination is not passed by the keyboard routine in BIOS. Note:

†101-key keyboard only ¥102-key keyboard only

Note:

- Some key numbers and scan-code numbers are missing because they are reserved by IBM.
 In set 1, Shift case adds an E0 AA preceding the make code and an E0 2A following the break
- code (for applicable keys only).
- In set 1, Num Lock case adds an E0 2A preceding the make code and an E0 AA following the break code (for applicable keys only).
- In set 2, Shift case adds an E0 F0 12 preceding the make code and an E0 12 following the break
- code (for applicable keys only).

 In set 2, Num Lock case adds an E0 12 preceding the make code and an E0 F0 12 following the break code (for applicable keys only).
- · Set 2 is the default set.

7.016. PC AND XT TYPE-AHEAD BUFFER LAYOUT

| | Offset | Length | Name | Description |
|---|--------|----------|-------------|--------------------------------------|
| | 0 (0) | word | Buffer_Head | Points to next character in buffer |
| ı | 2 (2) | word | Buffer_Tall | Points to next blank space in buffer |
| | 4 (4) | 32 bytes | Buffer Area | Area used to store keystroke data |

Note:

- If Buffer_Head = Buffer_Tall, the buffer is empty.
 Two bytes are necessary to store each keystroke, because the IBM extended keys (F1-F0, for example) consist of 2-byte codes. If the first byte for a keystroke is nonzero, then it represents the ASCII key, and the second byte is zero. If the first byte is zero, then it represents an extended key, and the second byte indicates the actual key pressed.
- Two low-memory words store the location of the buffer start (at 0040:0080) and one byte past its end (at 0040:0082).
- On a standard PC, the keyboard buffer is usually located at 0040:001A.

†Virtual resolution is 1056 by 200, 350, or 400 scan lines. Each character is 8 pixels wide.

Character height depends on font used.

YXGA supports all VGA modes, but only works on 386 or 486 machines.

Note:

- . EGA figures assume it has a full 256K of RAM.
- Modes 8-12 are used by PCjr only.
 The default XGA mode is VGA. XGA also supports special non-BIOS modes via the

HSMODE function, with the following new modes available:

| Mode | Screen Size | Cell Size | Rows | Cols |
|------|-------------|-----------|------|------|
| 0 | 1024x768 | 12x20 | 38 | 85 |
| 1 | 640x480 | 8x14 | 34 | 80 |
| 2 | 1024x768 | 8x14 | 54 | 128 |
| 3 | 1024x768 | 7x15 | 51 | 146 |

7.034. EGA MEMORY MAP

Buffer Start:

B000:8000

For Alphanumeric Text Display (modes 0-3):

Text data stored as follows: Even byte is character code.

Odd byte is attribute for character.

Upper-left corner of first page

Lower-right corner of first page

B000:879F for modes 2&3 8000:879F for modes 0&1

Up to eight consecutive pages in modes 0 and 1, four consecutive pages in modes 2 and 3

7.034. EGA MEMORY MAP (continued)

For Medium Resolution Graphics Display (320x200 all points addressable, modes 4 and 5):

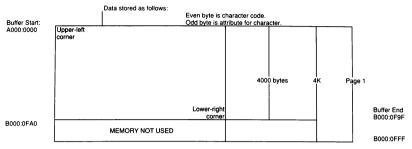

| Buffer Start: | | Data stored as follows: | Highest number Color of pixel is | vo bits long. red pixel is LO two bits.† s determined by 2-bit value. |
|---------------|-----------------------------|-------------------------|-------------------------------------|---|
| B000:8000 | Upper-left corner of eve | n scans (0, 2, 4198) | | |
| | | con | Lower-right ner of even scans | B000:9F3F |
| B000:9F40 | | MEMORY NOT USED | | B000:9FFF |
| B000:A000 | Upper-left corner of odd | scans (1,3,5199) | | 33330.1 |
| B000:BF40 | | со | Lower-right rner of odd scans | Buffer End: B000:BF3F |
| | | MEMORY NOT USED | | B000:BFFF |

For High Resolution Graphics Display (640x200 all points addressable, mode 6):

| Buffer Start: | | Data stored as follows: | Each pixel is on Highest number Pixel has no co | ne bit long. ered pixel is LO bit in byte. blor (is monochromatic). |
|---------------|-------------------------------|-------------------------|---|---|
| B000:8000 | Upper-left corner of even | scans (0, 2, 4198) | 1 1100 1100 110 | |
| B000:9F40 | | co | Lower-right rner of even scans | B000:9F3F |
| B000:9F40 | | MEMORY NOT USE |) | B000:9FFF |
| B000:A000 | Upper-left corner of odd s | cans (1,3,5199) | | |
| | | c | Lower-right orner of odd scans | Buffer End: B000:BF3F |
| B000:BF40 | | MEMORY NOT USE | · | B000:BFFF |
| | | | | (Continued) |

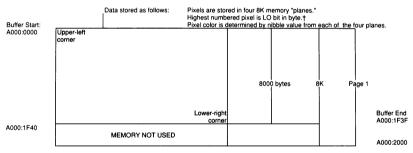

7.034. EGA MEMORY MAP (continued)

For Alphanumeric Text Display (mode 7):

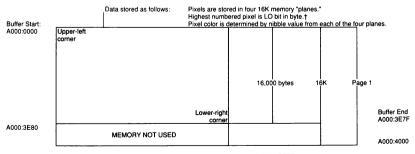

Up to seven additional pages follow sequentially, using memory through B000:7FFF.

For Medium Resolution Graphics Display (320x200 all points addressable, mode 13 (D)):

Up to three additional tables follow sequentially, using memory A000:7FFF.

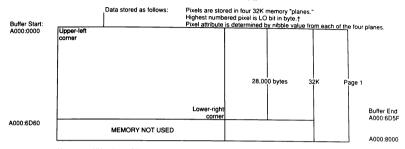

For High Resolution Graphics Display (640x200 all points addressable, mode 14 (E)):

Up to three additional tables follow sequentially, using memory through A000:FFFF.

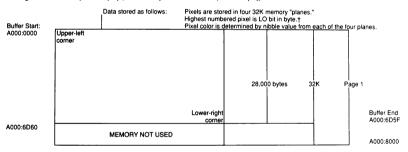

7.034. EGA MEMORY MAP (continued)

For High Resolution Graphics Display (640x350 all points addressable, mode 15 (F)):

Up to one additional page follows, using memory through A000:FFFF.

For High Resolution Graphics Display (640x350 all points addressable, mode 16 (10)):

Up to one additional page follows, using memory through A000:FFFF.

†In other words, the highest numbered pixel goes into the lowest bit (or bits), and the lowest numbered pixel goes into the highest bit (or bits).

For example:

-The first byte in medium resolution:

| Bit Number | 7 | 1 | 6 | 5 | 1 4 | 3 | 2 | 1 | 0 |
|--------------|---|---|---|-----|-----|---|---|---|---|
| Pixel Number | 1 | | | - 2 | 2 | | 3 | 4 | |
| | | | | | | | | | |

-The first byte in high resolution:

| Bit Number | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------|---|---|---|---|---|-----|---|-----|
| Pixel Number | 1 | 2 | 3 | 4 | 5 | 1 6 | 7 | . 8 |

Note: When in purely EGA modes, memory organization is four planes of either 16K or 64K.

and the use and definition of "pages" is up to the programmer.

| | | 12 | DWORD | address of pattern color definition |
| HSPATTO | Set Pattern Reference Point: sets | 0 | WORD | length of following data (p) |
| 101 7110 | reference point or origin for area fill | ž | PO | pattern reference point |
| | pattern symbols | ٠ ١ | " | pattern reterence point |
| HSLT | Cat Line Tympoles | | WORD | length of fellowing data (>4) |
| HOLI | Set Line Type: sets current line type to | 0 | | length of following data (≥1) |
| | the value specified | 2 | BYTE | line type value |
| | | 3 | BYTE | RESERVED |
| | | 4 | DWORD | address of user line type definition |
| HSLW | Set Line Width: sets current line width | 0 | WORD | length of following data (1) |
| | value | 2 | BYTE | line width value |
| ISCOL | Set Color: sets foreground color Index to | 0 | WORD | length of following data (4) |
| 10001 | the value specified | l ž | DWORD | color index |
| HSBCOL | | 6 | WORD | length of following data |
| HOBCOL | Set Background Color: sets background | | | |
| | color index to the value specified | 2 | DWORD | color Index |
| HSMX | Set Mix: sets value of color comparison | 0 | WORD | length of following data (2) |
| | register | 2 | BYTE | foreground mix value |
| | i - | 3 | BYTE | background mix value |
| HSCMP | Set Color Comparison Register: sets value | 0 | WORD | length of following data (5) |
| | of color comparison register | 2 | DWORD | comparison color index |
| | | 6 | BYTE | logic function |
| ISCS | Set Character Set: sets current character | ĭ | WORD | length of following data(4) |
| 1303 | set | 2 | DWORD | address of character set definition block |
| IOLIOT | | | | |
| HCHST | Character Set at Given Point: draws a | 0 | WORD | length of following data (≥p+s) |
| | character string at a given position | 2 | P0 | coordinate of point at which the bottom left |
| | | } | | corner of string is placed |
| | | 2+p | STRING | list of code points in string |
| ICCHST | Character String at Current Position: | 0 | WORD | length of following data (≥0) |
| | draws character string at current position | 2 | STRING | list of code points in string |
| IXLATE | Assign Multiplane Text Color Index Table: | 1 6 | WORD | length of following data (32) |
| INCATE | provides color index translate table for use | , ° | WORD | length of following data (32) |
| | | ۱ ۵۵۵ | 4 0000000 | 0.4 |
| D. 00.015 | with multiplane text orders | 2-30 | 8 DWORDS | 8 translate table entries |
| ABLOCKMFI | Write Character Block: writes block of | 0 | WORD | length of following data (10) |
| | characters to bit planes in MFI (mainframe | 2 | BYTE | start column |
| | Interactive) mode | 3 | BYTE | start row |
| | 1 | 4 | BYTE | number of char cells across |
| | 1 | l š | BYTE | number of char cells down |
| | 1 | ١ ، | DWORD | start address of character block |
| | 1 | | | |
| | 1 | 10 | BYTE | width of character buffer |
| | 4 | 11 | BYTE | RESERVED (must be 0) |
| BLOCKCGA | Write Character Block (CGA): writes block | 0 | WORD | length of following data (10) |
| | of characters to bit planes in MFI mode. | 2 | BYTE | start column |
| | Supports 2-byte character attribute |] 3 | BYTE | start row |
| | sequence for color graphics adapter | Ă | BYTE | number of char cells across |
| | | 5 | BYTE | number of char cells down |
| | (CGA) operation | | | |
| | 1 | 6 | DWORD | start address of character block |
| | 1 | 10 | BYTE | width of character buffer |
| | | - 11 | BYTE | highlight attribute for block |
| SCELL | Set Alpha Cell Size: sets cell size for alpha- | 0 | WORD | length of following data (2) |
| IOUELL. | | | | |
| SCELL | numeric operations | 2 | BYTE | cell width in pels |

^{* =} value Ignored, may be 1 or 0

MT = multitrack operation (high=TRUE) MF = FM mode (high=MFM, low=FM) SK = skip deleted data address mark Legend:

HD = head number US0 = unit select zero US1 = unit select one

The terms "track" and "cylinder" are used interchangeably in the IBM documentation. Note:

7.065, PS/2 POS DESCRIPTOR FILE FORMAT

| Command Syntax | Function | Example* | Example Explanation |
|--|--------------------------------------|--|---|
| ADAPTER ID number | Defines card's ID number | Adapterid 0DEAFh | Card's ID is ODEAF hex |
| ADAPTER NAME string | Defines card's name | AdapterName "Thom's Hearing Aid" | Card's name is "Thom's Hearing Aid" |
| NUMBYTES number | Number of POS bytes used | NumBytes 2 | Card uses 2 POS bytes |
| FIXED RESOURCES pos setting resource setting | Defines resources required by card | FixedResources POS[1]="XXXXXXX01" int 3 | Card uses first POS byte, LO 2 bits |
| NAMED ITEM prompt (choice) help | Defines choices for a resource | Named_Item Prompt *Communications Port to Use:* choice *COM1** pos(0)=XXXXXXX01b to 038th-038th int 4 choice *COM2** pos(0)=XXXXXXX10b to 028th-028th int 3 Help *select 1 of the two serial ports listed* | Names an item in pos[0] used to store the user's choice of serial ports |
| PROMPT string | Defines a string | See Named Item, above | |
| CHOICE choice_name pos setting resource setting | Defines a named choice | See Named Item, above | |
| HELP string | Defines a help string | See Named Item, above | |
| POS[number]=bitlist | Defines 1 or more POS byte settings | Pos[0]=XX1XX0XXb | X=ignored, 1=set bit, 0=clear bit |
| O (range) | Defines 1 or more I/O address ranges | io 03f8h-03ffh | |
| NT (number) | Defines 1 or more Interrupts used | int 4 | |
| ARB (number) | Defines 1 or more arbitration levels | ARB 1 | Sets arbitration level 1 |
| MEM (range) | Defines 1 or more memory ranges | MEM 0C0000h-0CFFFFh | Card uses mem from 0C0000-CFFFF |

*Keywords are not case-sensitive. The case is preserved in text strings. Blanks, tabs, and new lines are ignored except in text strings. Lines beginning with semicolons are ignored.

Does not apply to Model 25 or 30. Version:

• IO. INT, ARB, and MEM are resource_settings. Note:

POS is a pos_setting.

• File must contain at least one Card_ID, one Card_Name, and NumBytes; all else is optional.

*Refers to IBM Graphics Printer, IBM Color Printer, and IBM Compact Printer, respectively. †Number of characters to print

Note: . Characters enclosed in brackets are ASCII code names, as in <ESC>.

*# should be replaced by the relevant numeric value in this chart.
 • (data) Indicates a blistream of appropriately formatted data.
 • Numbers in "bit Image graphics modes" indicate number of data bytes that follow.

IBM Options and Adapters Technical Reference, Vol. 1, pages Graphics Printer 4 through 6, Color Printer 9 through 35,

and Compact Printer 3 through 10

7.091. HAYES MODEM COMMAND SET

| Command | Function | Allowable Values/Comments | | |
|---------|---|--|--|--|
| AT | Attention | Starts all commands | | |
| ATI# | Request product code and ROM checksum | #=0 modem sends its 3-digit product code | | |
| | I ' ' | #=1 request numeric checksum of firmware ROM | | |
| | l, | #=2 request OK or ERROR state of ROM checksum | | |
| A/ | Repeat last command | Not AT or Return commands | | |
| Ā | Answer without waiting for ring | | | |
| B# | Bell 1200 bps protocol mode | #=0 CCITT v.22/v.22bis | | |
| | | #=1 Bell 212A | | |
| C# | Carrier state | #=0 off | | |
| • | Julius State | #=1 on | | |
| D# | Dial telephone number | #=telephone number (may include / or - chars) | | |
| E# | Echo modern commands | #=0 no | | |
| | Lane medern commands | #=1 yes | | |
| F# | Set duplex | #=0 set haif duplex | | |
| | Set duplex | #=1 set full duplex | | |
| H# | Set hook status | #=0 on hook (hang up) | | |
| 11# | Set Hook status | #=1 off hook | | |
| L# | Set speaker volume | #=0 or 1 low | | |
| L# | Set speaker volume | #=2 medium | | |
| | | #=2 high | | |
| M# | Set speaker mode | #=0 off | | |
| IVI# | Ser sheaver mode | #=0 OII #=1 OD | | |
| | | | | |
| | | #=2 always on | | |
| | | #=3 disable speaker when carrier received | | |
| O# | Set on-line state | #=0 modem returns to on-line state | | |
| | | #=1 modem returns on-line and retrains equalizer* | | |
| Р | Set pulse dialing mode | | | |
| Q# | Set quiet command state | #=0 commands are sent | | |
| | | #=1 commands are not sent | | |
| R | Reserve mode | Use answer frequencies when originating call | | |
| S | Dial stored number | | | |
| | Set S-register | #=S-register number; value=value to set register to | | |
| S#? | Display S-register value | #=S-register number | | |
| T | Set tone dialing mode | | | |
| V# | Set verbose mode | #=0 use digits | | |
| | | #=1 use words | | |
| W | Wait for second dial or access tone | | | |
| X# | Enable extended result code & mode setting | #=0 basic (300 bps) | | |
| | 1 | #=1 extended (no dialtone or busy signal detect) | | |
| | | #=2 extended (detects dialtone but not busy signals) | | |
| | | #=3 extended (no dialtone detect but detects busy signal) | | |
| | | #=4 extended (detects both dialtones and busy signals) | | |
| Y# | Long space disconnect | #=0 disabled | | |
| | Long space disconnect | #=1 enabled (disconnects after receiving 1.6 sec break) | | |
| z | Fetch configuration profile from nonvolatile memory | m=1 - Gridatics [Gracorificots differ recovering 115 - 54 61-64] | | |
| | | | | |
| | Wait for quiet answer Pause | Delay in dialing sequence | | |
| + - | | On-hook for 1/2 second | | |
| | Flash | Un-nook for 1/2 Second | | |
| | Return to command mode after dialing | | | |

7.091. HAYES MODEM COMMAND SET (continued)

| Command | Function | Allowable Values/Comments |
|---------|--|--|
| &C# | Set data carrier detect handling | #=0 modem keeps DCD on |
| | | #=1 DCD tracks data carrier detect |
| &D# | Set DTR handling | #=0 modem ignores DTR |
| | 1 | #=1 modem assumes command state when DTR triggered |
| | | #=2 DTR off switches modem off hook |
| | | #=3 DTR off initializes modem |
| &F | Fetch factory configuration profile from ROM | |
| &G# | Set guard tone selection | #=0 no guard tones |
| | | #=1 550 Hz guard tone |
| | | #=2 1800 guard tone |
| &J# | Set telephone jack selection | #=0 RJ11, RJ41S, or RJ45S |
| | | #=1 RJ12 or RJ13 |
| &L# | Set leased line or dialup line selection | #=0 dialup operation |
| | | #=1 leased line operation |
| &M# | Set async/sync mode selection | #=0 asynchronous |
| | ' ' | #=1 synchronous mode 1 (async dialing, then sync comm) |
| | | #=2 synchronous mode 2 (stored number dialing) |
| | | #=3 synchronous mode 3 (manual dialing) |
| &P# | Set pulse dial and length | #=0 39% make, 61% break (US, Canadian standard) |
| | · · · · · · · · · · · · · · · · · · · | #=1 33% make, 67% break |
| &R# | Set RTS and CTS handling | #=0 CTS tracks RTS |
| | l | #=1 modem ignores RTS, CTS turned on to recieve sync data |
| &S# | Set DSR handling | #=0 modem forces DSR when modem turned on |
| | | #=1 DSR operates according to EIA specifications |
| &T# | Set test mode | #=0 terminate any test in progress (when last command on line) |
| | | #=1 initiate local analog loopback test |
| | | #=3 initiate local digital loopback test |
| | | #=4 conditions modem to perform remote digital loopback |
| | | #=5 prohibits remote digital loopback |
| | | #=6 initiates remote digital loopback with another modem |
| | | #=7 or 8 Intiates remote digital loopback with self-test |
| &W | Write active configuration to memory | |
| 8.X# | Select sync transmit clock source (In sync mode) | #=0 modem generates and sends through pin 15 |
| - | , | #=1 host computer sends through pin 24, modem routes to pin 15 |
| | | #=2 modem derives timing from incoming signal, sends to pin 15 |
| &Z# | Store telephone number | # is telephone number compatible with Dial command |

^{*2400-}baud mode only

7.103. 8086 FAMILY MEMORY ADDRESSING MODES

| Mode | Example | Explanation |
|----------------------------|------------------|--|
| Direct register addressing | ADD AX,BX | Uses contents of registers for operation |
| Indirect memory addressing | ADD AX,[BX] | Uses BX as a relative offset to point to memory |
| | ADD [BX],AX | <u> </u> |
| Immediate addressing | ADD AX,123 | Uses immediate value (123) |
| Based addressing | MOV AX[BX+2] | Uses the value 2 bytes past the offset contained in BX |
| | MOV AX,2[BX] | • • |
| Indexed addressing | MOV AX,[SI+2] | Uses the value 2 bytes past the offset contained in SI |
| | MOV AX,2[SI] | |
| Based indexed addressing | MOV AX,[BP+SI+2] | Uses the sum of BP and SI, plus two |
| | MOV AX,2[BP+SI] | '' |
| | MOV AX,2[BP][SI] | |
| String addressing | MOVSB | Coples the string from memory at DS:[SI] to ES:[DI] |

| XOR reg. imm | Exclusive OR | 1-4 | Overflow=0, sign, zero, parity, | Aux | 1 | 7 | 1 | 1, |
| | | 1 | carry=0 | | 1 | 1 | 1 | 1 |
| XOR reg, mem | Exclusive OR | 1-4 | Overflow=0, sign, zero, parity. | Aux | | 1 | 1, | 1, |
| | 1 | 1 | carry=0 | | 1 | 1 | 1 | 1 |
| XOR reg, reg | Exclusive OR | 1-4 | Overflow=0, sign, zero, parity, | Aux | 7 | 1 | 1 | ٧, |
| | 1 | 1 | carry=0 | 1 | | 1 | 1 | 1 |

§Number of bytes in instruction varies slightly depending on actual CPU used.

Flags:

EFLAGS is a 32-bit register in the 80386. FLAGS (LO word of EFLAGS) is a 16-bit register.

Legend: reg=register

mem=memory accum=accumulator (AL, AX, EAX) imm=immediate

segreg=segment register
offset=offset from current CS:IP

Note: Number preceding Item indicates number of bit:

| E Flags | Regist | |
|---------|--------|----------------------|
| Bit | Abbr. | Name |
| 0 | CF | Carry flag |
| | | RESERVED |
| 2 | PF | Parity flag |
| 3 | | RESERVED |
| 4 | AF | Auxiliary carry flag |
| 5 | | RESERVED |
| 6 | ZF | Zero flag |
| . 7 | SF | Sign flag |
| 8 | TF | Trap flag |
| 9 | F | Interrupt enable |
| 10 | DF | Direction flag |
| 11 | OF | Overflow |
| 12-13 | IOPL | I/O privilege level |
| 14 | NT | Nested tank flag |
| 15 | | RESERVED |
| 16 | RF | Resume flag |
| 17 | VM | Virtual 8086 mode |
| 18 | AC | Alignment check |
| 19-31 | | RESERVED |

7.106, 8086 FAMILY CPU CHIP VERSIONS

| Chip | Clock Speed | Comments |
|----------|-------------|--|
| 8086 | 5Mhz | 16-bit CPU in 40-pin CERDIP or plastic DIP package |
| 8086-1 | 10Mhz | 16-bit CPU in 40-pin CERDIP or plastic DIP package |
| 8086-2 | 8Mhz | 16-bit CPU in 40-pin CERDIP or plastic DIP package |
| 80C86 | 5Mhz | 16-bit CMOS CPU in 40-pin DIP or 44-pin PLCC package |
| 80C86-2 | 8Mhz | 16-bit CMOS CPU in 40-pin DIP |
| 8088 | 5Mhz | 8-bit CPU in 40-pin CERDIP package |
| 8088-2 | 8Mhz | 8-bit CPU in 40-pin CERDIP package |
| 80C88 | 5Mhz | 8-bit CMOS CPU in 40-pin DIP or 44-pin PLCC package |
| 80C88-2 | 8Mhz | 8-bit CMOS CPU in 40-pin DIP or 44-pin PLCC package |
| 80286-6 | 6Mhz | 16-bit Protection mode CPU in 68-pin LCC, PLCC, or PGA package |
| 80286-8 | 8Mhz | 16-bit Protection mode CPU in 68-pin LCC, PLCC, or PGA package |
| 80286-10 | 10Mhz | 16-bit Protection mode CPU in 68-pin LCC, PLCC, or PGA package |
| 80286-12 | 12.5Mhz | 16-bit Protection mode CPU in 68-pin LCC, PLCC, or PGA package |
| 80386 | 16-33Mhz | 32-bit Protection mode CPU in 132 PGA package |
| 80386SX | 16-20Mhz | 100-pin quad flatpack package |
| 486 | 25-33Mhz | 168-pin PGA package |

Note: Numbers are Intel numbers only. NEC makes compatible CPUs with numbers like V10, V20, etc.

| Upper D18 | | |
| Upper D19 | | Used by system board to grant bus access |
| 22201213 | | Cocc of Cloton board to grant boo doccoo |

Note: · All signals are at standard TTL levels.

An agunas are at standard 1 It. levels.
 Connector is a special two-flered 62-pin edge connector with a secondary 36-pin edge connector.
 A or C-component side of board; numbers start closest to rear panel of machine.
 Upper refers to EISA extensions in upper tier of connector.

Select Bibliography

The following listing of works includes the primary or secondary sources of information used during the compilation of the second edition of this book. Where possible, complete bibliographic data has been provided, though for many sources it was difficult to ascertain the correct information from the documents themselves and so not all sources listed below include what is considered by traditional standards complete bibliographic information.

The first edition of *The Programmer's PC Sourcebook* included document or ISBN numbers for the books listed in its Bibliography. Since the first edition was published, however, many more primary and secondary source documents have been produced, both as updates to existing documents and completely new documents. Because document and ISBN numbers were difficult to ascertain for many of these sources, and because the constant change in these numbers by their manufacturers between editions (and sometimes even between printings) makes them of little value to readers to use as identifying factors, they are not included below.

The page numbers given for journal articles indicate either the page on which the article begins (when intervening material forces the reader to continue the article elsewhere in the journal), the range of pages (when no intervening material is present) which constitute the article, or the exact page on which the noteworthy information occurs.

The manuscript for this book was prepared and submitted to Microsoft Press in electronic form. Table files were processed and formatted using Microsoft Excel.

Pasteup and layout: Margarite Hargrave Cover designer: Becky Geisler-Johnson Cover color separator: Color Service Inc.

Table composition by Online Press in Helvetica and Helvetica Narrow with display type in Helvetica Bold, using Microsoft Excel 2.2. Text composition by Microsoft Press in Times Roman with display type in Times Roman Bold, using PageMaker 4.0. Final camera-ready copy produced by a NewGen laser printer.

Great Programming Resources from Microsoft Press

MICROSOFT® MS-DOS® PROGRAMMER'S REFERENCE

This is Microsoft's official reference to the MS-DOS operating system—an absolute necessity for every DOS programmer. This comprehensive resource is updated to version 5 and provides easy access to essential information about the structure of MS-DOS and its programming interface. The heart of this book is a comprehensive reference to hundreds of MS-DOS system interrupts and functions. There are details on syntax and usage along with information on special notes, warnings, and version compatibility. The coverage of Interrupt 21h functions is indispensable to assembly language programmers. The MICROSOFT MS-DOS PROGRAMMER'S REFERENCE contains a wealth of information including: The file system Tregister contents Device drivers Software interrupts Punction definitions

- Data structures Task-switching protocol Control blocks and work areas EXE file structure and loading
- Error codes Character input and output Font-file formats National language support

PROGRAMMING WINDOWS.™ 2nd ed.

Charles Petzold

This edition of PROGRAMMING WINDOWS—completely updated and revised to highlight version 3 capabilities—
is packed with keen insight, tried-and-true programming techniques, scores of complete sample programs written in C, and
straightforward explanations of the Microsoft Windows programing environment. Topics cover Dynamic Data Exchange
(DDE), the Multiple Document Interface (MDI) features, reading input, using resources, the graphics device interface (GDI),
and data exchange and links. PROGRAMMING WINDOWS is the most authoritative, example-packed, and thorough
resource for programmers new to the Microsoft Windows version 3 graphical environment, those familiar with earlier
versions, and anyone looking for information on the dynamics and structure of the Microsoft Windows environment.

THE MICROSOFT® VISUAL BASIC™ WORKSHOP

John Clark Craig

Create Windows applications quickly with Microsoft Visual Basic and THE MICROSOFT VISUAL BASIC WORKSHOP. Whether you're a new or experienced Windows programmer, you'll find this book-and-disk package invaluable. It includes dozens of ready-to-use Visual Basic routines and applications that can be easily incorporated into your Windows programming projects. The author provides helpful overviews of both Visual Basic and event-driven programming. Also covered are advanced programming concepts—using Dynamic Data Exchange using the Windows Applications Programming Interface, creating Dynamic Link Libraries, and using Windows graphics.

NOTE: Both executable and source-code files are include so you can preview Visual Basic if you don't already own it!

320 pages; includes one 5 ½ 1.2 MB disk. \$34.95 (\$44.95 Canada) Order Code VIBAWO

MICROSOFT® WINDOWS™ 3 DEVELOPER'S WORKSHOP

Richard Wilton

This example-packed programming resource provides rich and detailed discussions of some of the central—and most complex—areas of programming for Windows. Wilton addresses topics that concern every serious Windows programmer: debugging, building custom controls, interprocess communication through Dynamic Data Exchange, using Dynamic Link Libraries, and tapping into the added functionality of Windows' DDE programming interface, the DDE Management Library. Wilton takes a practical, problem-solving approach, explaining how to combine effective programming practices with good design.

MICROSOFT® WINDOWS™ PROGRAMMER'S REFERENCE LIBRARY

The core documentation—including both technical data and programming tutorials—that Microsoft provides with the Microsoft Windows Software Developer's Kit (SDK). Now this documentation is available separately. These three volumes provide the most accurate and up-to-date Windows 3 programming information available.

MICROSOFT® WINDOWS™ PROGRAMMER'S REFERENCE

If you are a Windows programmer, you need this up-to-date, comprehensive reference to each component in the Windows Application Programming Interface (API). Included is detailed information on every Windows version 3 function, message, data type, resource-compiler statement, assembly-language macro, and file format. This information is the foundation for any program that takes advantage of Windows' special capabilities: data interchange with other applications; device-independent graphics; multitasking; dynamic linking and shared display; and memory, keyboard, mouse, and system timer resources.

1136 pages \$39.95 (49.95 Canada) Order Code WIPRRE

MICROSOFT® WINDOWS™ PROGRAMMING TOOLS

Detailed information on using the C compiler and the linker to compile and link source files and on using the Resource Compiler to compile application resources. In addition, you'll find information on debugging tools (including CodeView) and on using the resource editors and optimizing tools that come with the Microsoft Windows Software Development Kit. Of special importance is the section on the Windows Help system—its design and its programming guidelines.

384 pages \$24.95 (\$32.95 Canada) Order Code WIPRTO

MICROSOFT® WINDOWS™ GUIDE TO PROGRAMMING

An example-packed introduction for experienced C programmers who use the Microsoft Windows version 3 Application Programming Interface (API). You'll discover how to use Windows' functions, messages, and data structures to build efficient and reliable programs. If you've never before programmed for Windows, you'll appreciate the step-by-step instructions accompanied by dozens of sample applications you can compile and run under Windows. Key topics: using the graphics device interface (GDI) to create your own output; processing input from the keyboard and the mouse; using push buttons and list boxes; using the Clipboard; working with printers; displaying bitmaps; and more. You'll also find introductory information on advanced topics, including memory management, dynamic data exchange, and printer initialization.

560 pages \$29.95 (39.95 Canada) Order Code WIGUPR

The Waite Group's MICROSOFT QUICKBASIC™ PRIMER PLUS

The Waite Group: Stephen Prata with Harry Henderson

This is the ideal introduction—and more—for anyone eager to explore the Microsoft QuickBASIC programming environment. Covering Microsoft QuickBASIC version 4.5, this book provides step-by-step instructions, clear and helpful explanations, superb programming examples, and expert advice. You'll also find detailed information on topics not fully covered in standard introductions—graphics, debugging, sound, error trapping, interaction with DOS, and mixed-language programming. In addition, each chapter includes a series of review questions and answers so that you can chart your progress. 624 pages \$24.95 (\$32.95 Canada) Order Code OBPRPL

The Waite Group's Microsoft QuickBasic™ Bible

Mitchell Waite, Robert Arnson, Christy Gemmell, and Harry Henderson

This is the cornerstone of every QuickBasic Programmer's library, featuring up-to-date, detailed information on every QuickBasic keyword, statement, function, and feature through version 4.5. Each entry includes: ■ purpose, syntax, and specific uses ■ an operational description ■ cross-references to other data ■ compatibility information for nine other versions of Basic. The authors also provide hundreds of instructive programming examples and tutorials as well as helpful warnings and tips.

LEARN C NOW

Augie Hansen

Learn how to program in C, quickly and painlessly, with LEARN C NOW. This completely integrated system is designed to make C programming fun and easy to learn on any microcomputer running MS-DOS. This unique package includes three 5 ¼-inch disks and a companion book. It gives you everything you need to learn C at your own pace before purchasing expensive programming tools. The disks contain lessons in C programming, with detailed information on using the Learn C Compiler; the Learn C in-memory compiler, based on Microsoft QuickC and featuring a full screen editor, debugger, online task-specific help, and blazing 7000 line-per-minute compiler speed; and scores of sample programs. Complementing the online information, Hansen's companion book provides lessons in C programming, question-and-answer sections, and helpful recommendations for getting the most out of this excellent course. And with your copy of LEARN C NOW, you'll also receive a special discount coupon for the full-strength Microsoft QuickC Compiler with Microsoft QuickAssembler.

384 pages with three 51/4-inch disks \$39.95 (\$49.95 Canada) Order Code LECNO

MICROSOFT'S 80386/80486 PROGRAMMING GUIDE, 2nd ed.

Ross P. Nelson

Here is a clear, comprehensive, and authoritative introduction to the premier line of Intel chips—including the 803865X, 80386DX, and 80486. This reference is loaded with illustrations and is ideal for assembly language programmers, microprocessor design engineers, and students of computer architecture. Ross Nelson, an early adviser to the 80386 development team at Intel covers CPU organization of the 80287 and 80387 math coprocessors, memory architecture, protection schemes, the basic instruction set and the floating-point instruction set, implementation of a virtual memory system through paging and cache management with the 80486, and more. Every serious 80386 and 80486 programmer will appreciate the clearly organized instruction set reference—a valuable resource.

496 pages \$24.95 (\$34.95 Canada) Order Code 80PRGU

MICROSOFT® MOUSE PROGRAMMER'S REFERENCE, 2nd ed.

This is the official documentation for programming the Microsoft Mouse. It provides all the software and how-to information you need to incorporate a sophisticated mouse interface for MS-DOS operating system-based programs. Fully updated to cover Microsoft BallPoint mouse and the mouse driver version 8, this new edition includes: sample programs that demonstrate mouse programming in six PC programming languages; a complete reference to all mouse function calls; an overview of mouse programming; detailed information about writing and using mouse menu programs; comprehensive index; and much mone. The two 5 ½-inch companion disks include sample mouse menus, MOUSE.LIB and EGA.LIB, and a collection of valuable programming examples in interpreted Basic, Microsoft QuickBasic, Microsoft QuickC, Microsoft Macro Assembler, FORTRAN, and Pascal.

352 pages with two 5 1/4-inch disks \$34.95 (\$44.95 Canada) Order Code MOPRR2

Microsoft Press books are available wherever quality computer books are sold. Prices subject to change.

Or call 1-800-MSPRESS for ordering information or placing credit card orders.

"Truly a careful distillation and condensation of the detailed technical contents of dozens of manuals, references, books, papers, and the author's own vears of experience. It is an outstanding example of professional handbook."

THE PROGRAMMER'S PCSOURCEBOOK

Check your facts—fast—with this one-of-a-kind reference!

Whatever you need to know about a PC—card sizes, cable connections, ROM BIOS routines, internal registers, DOS* functions, and so on—you'll find the information here. This unique resource integrates in one convenient volume important factual data published in scores of technical and user references.

This new edition is designed to be your primary reference to information about the latest software and hardware, including MS-DOS 5, Windows 3, and the PS/2® models 80, 90, and 95. Information about older systems is also retained throughout the book, and equivalent features of earlier software versions are identified.

The material is easily retrievable, presented in hundreds of charts and tables that include references to the source of the data, "pointers" to related information in the book, and notes to help you use the information. Topics include:

- Numeric conversions and character sets
- DOS commands and utilities
- Microprocessor chip pinouts and instruction sets, including the 80486, 386SX, and 80387
- New Lotus[®]/Intel[®]/Microsoft (LIM) 4.0 Expanded Memory Specification (EMS) abilities
- DOS function calls

- ROM BIOS function calls
- Microsoft Windows function calls
- Microsoft CD-ROM extensions
- The Microsoft BallPoint TM mouse, Hayes® modem, Extended Graphics Adapter (XGA), and other peripherals
- Virtual Control Programming Interface (VCPI) function calls

THE PROGRAMMER'S PC SOURCEBOOK—a must-have computerside reference for DOS and Windows programmers!

* DOS refers to the MS-DOS and PC-DOS operating systems.
